RICAM-Report 2013-24
Reconstruction of interfaces using CGO solutions for the Maxwell equations
Manas Kar∗ Mourad Sini †
October 25, 2013

Abstract
We deal with the problem of reconstructing interfaces using complex geometrical optics solutions for the Maxwell system. The contributions are twofold. First, we justify the enclosure method for the impenetrable obstacle case avoiding any assumption on the directions of the phases of the CGO’s (or the curvature of obstacle’s surface). In addition, we need only a Lipschitz regularity of this surface. The analysis is based on some fine properties of the corresponding layer potentials in appropriate Sobolev spaces. Second, we justify this method also for the penetrable case, where the interface is modeled by the jump (or the discontinuity) of the magnetic permeability \(\mu\). A key point of the analysis is the global \(L^p\)-estimates for the curl of the solutions of the Maxwell system with discontinuous coefficients. These estimates are justified here for \(p\) near 2 generalizing to the Maxwell’s case the well known Meyers’s \(L^p\) estimates of the gradient of the solution of scalar divergence form elliptic problems.

1 Introduction and statement of the results:
Let \(\Omega \subset \mathbb{R}^3\) be a bounded domain with \(C^1\)-smooth boundary. Let \(D\) be a subset of \(\Omega\) with Lipschitz boundary and the connected complement \(\mathbb{R}^3 \setminus \overline{D}\). We are concerned with the electromagnetic wave propagation in an isotropic medium in \(\mathbb{R}^3\) with the electric permittivity \(\epsilon > 0\) and the magnetic permeability \(\mu > 0\). We assume \(\epsilon \in W^{1,\infty}(\Omega)\) such that \(\epsilon = 1\) in \(\Omega \setminus \overline{D}\). We also assume \(\mu(x) := 1 - \mu_D(x)\chi_D(x)\) to be a measurable function, where \(\mu_D \in L^\infty(D)\) and \(\chi_D\) is the characteristic function of \(D\) such that \(|\mu_D| \geq C > 0\). If we denote by \(E, H\) the electric and the magnetic fields respectively, then the first problem we are interested with is the impenetrable obstacle problem

\[
\begin{cases}
\text{curl} \, E - ikH = 0 \quad \text{in} \; \Omega \setminus \overline{D}, \\
\text{curl} \, H + i\kappa E = 0 \quad \text{in} \; \Omega \setminus \overline{D}, \\
\nu \wedge E = f \quad \text{on} \; \partial \Omega, \\
\nu \wedge H = 0 \quad \text{on} \; \partial D,
\end{cases}
\]

(1.1)

and the second one is the penetrable obstacle problem

\[
\begin{cases}
\text{curl} \, E - ik\mu H = 0 \quad \text{in} \; \Omega, \\
\text{curl} \, H + i\kappa E = 0 \quad \text{in} \; \Omega, \\
\nu \wedge E = f \quad \text{on} \; \partial \Omega,
\end{cases}
\]

where \( \nu \) is the unit outer normal vector on \( \partial \Omega \cup \partial D \) and \( k > 0 \) is the wave number. Assume that \( k \) is not an eigenvalue for the spectral problem corresponding to \((1.1)\) or \((1.2)\). Then both the problems \((1.1)\) and \((1.2)\) are well posed in the spaces \( H(\text{curl}; \Omega \setminus D) \) and \( H(\text{curl}; \Omega) \) respectively, see \[2\] and \[11\] for instance.

**Impedance Map:** We define the impedance map \( \Lambda_D : TH^{-\frac{3}{2}}(\partial \Omega) \rightarrow TH^{-\frac{3}{2}}(\partial \Omega) \) for either the exterior or the interior problems as follows:

\[
\Lambda_D(\nu \wedge E|_{\partial \Omega}) = (\nu \wedge H|_{\partial \Omega}),
\]

where \( TH^{-\frac{3}{2}}(\partial \Omega) := \{ f \in H^{-\frac{3}{2}}(\partial \Omega)/\nu \cdot f = 0 \} \). This impedance map is bounded. We denote by \( \Lambda_0 \) the impedance map for the domain without an obstacle.

**Construction of CGO solutions:** In \[22\], the complex geometrical optic solutions for the Maxwell’s equation were constructed as follows. Let \( \rho, \rho^\perp \in \mathbb{S}^2 \) with \( \rho \cdot \rho^\perp = 0 \). Given \( \theta, \eta \in \mathbb{C}^3 \) of the form

\[
\eta := \frac{1}{|\zeta|}(-\zeta \cdot a)\zeta - k\zeta \wedge b + k^2a) \quad \text{and} \quad \theta := \frac{1}{|\zeta|}(k\zeta \wedge a - (\zeta \cdot b)\zeta + k^2b)
\]

where \( \zeta = -i\tau \rho + \sqrt{\tau^2 + k^2}\rho^\perp \) and \( a \in \mathbb{R}^3, b \in \mathbb{C}^3 \), then for \( \tau > 0 \) large enough, there exists a unique (complex geometrical optic) solution \( (E_0, H_0) \in H^1(\Omega) \times H^1(\Omega) \) of Maxwell’s equations

\[
\begin{align*}
\text{curl } E_0 - ikH_0 &= 0 \quad \text{in } \Omega, \\
\text{curl } H_0 + ikE_0 &= 0 \quad \text{in } \Omega,
\end{align*}
\]

of the form

\[
\begin{align*}
E_0 &= \eta e^{\tau(x \cdot \rho + i\sqrt{\tau^2 + k^2}x \cdot \rho^\perp)}, \\
H_0 &= \theta e^{\tau(x \cdot \rho + i\sqrt{\tau^2 + k^2}x \cdot \rho^\perp)}.
\end{align*}
\]

In our work we use special cases of these CGO solutions. Precisely, in the impenetrable obstacle case, we choose \( a \) and \( b \) such that \( a = \sqrt{2}\rho^\perp, b \perp \rho \) and \( b \perp \rho^\perp \). Hence in this case, we have \( \eta = \mathcal{O}(\tau) \) and \( \theta = \mathcal{O}(1) \), for \( \tau \gg 1 \). For the penetrable obstacle case, we choose \( a \) and \( b \) such that \( a \perp \rho, a \perp \rho^\perp \) and \( b = \tilde{\zeta} \), where \( \tilde{\zeta} = \frac{\rho^\perp}{|\rho^\perp|} \). In this case, we have \( \eta = \mathcal{O}(1) \) and \( \theta = \mathcal{O}(\tau) \), for \( \tau \gg 1 \). Adding a parameter \( t > 0 \) into the CGO-solutions, we set, using the same notations,

\[
\begin{align*}
E_0 &= \eta e^{\tau(x \cdot \rho - t + i\sqrt{\tau^2 + k^2}x \cdot \rho^\perp)}, \\
H_0 &= \theta e^{\tau(x \cdot \rho - t + i\sqrt{\tau^2 + k^2}x \cdot \rho^\perp)}.
\end{align*}
\]

**Indicator Function:** For \( \rho \in \mathbb{S}^2, \tau > 0 \) and \( t > 0 \) we define the indicator function

\[
I_\rho(\tau, t) := ik\tau \int_{\partial \Omega} (\nu \wedge E_0) \cdot ((\Lambda_D - \Lambda_\rho)(\nu \wedge E_0) \wedge \nu)dS
\]

where \( E_0 \) is the CGO solution of Maxwell’s equations given above.

**Support Function:** For \( \rho \in \mathbb{S}^2 \), we define the support function of \( D \) by \( h_D(\rho) := \sup_{x \in D} x \cdot \rho \).

Now, we state our main result.

**Theorem 1.1.** Let \( \rho \in \mathbb{S}^2 \). For both the penetrable and the impenetrable cases, we have the following characterizations of \( h_D(\rho) \).

\[
|I_\rho(\tau, t)| \leq Ce^{-ct}, \quad \tau \gg 1, \ c, C > 0, \ \text{and in particular,} \quad \lim_{\tau \to \infty} |I_\rho(\tau, t)| = 0 \quad (t > h_D(\rho)), \quad (1.7)
\]

\[
\lim_{\tau \to \infty} \inf_{t} |I_\rho(\tau, h_D(\rho))| > 0, \quad (1.8)
\]

\[
|I_\rho(\tau, t)| \geq Ce^{ct}, \quad \tau \gg 1, \ c, C > 0, \ \text{and in particular,} \quad \lim_{\tau \to \infty} |I_\rho(\tau, t)| = \infty \quad (t < h_D(\rho)). \quad (1.9)
\]
From this theorem, we see that, for a fixed direction \( \rho \), the behavior of the indicator function \( I_\tau(\rho, t) \) changes drastically in terms of \( \tau \): exponentially decaying if \( t > h_D(\rho) \), polynomially behaving if \( t = h_D(\rho) \) and exponentially growing if \( t < h_D(\rho) \). This feature can be used to reconstruct the support function \( h_D(\rho), \rho \in S^2 \) from the data: \( \Lambda_D(\nabla \cdot E_0|_{\partial D}) \) with \( E_0 \) given by the CGO solutions. Hence, using Theorem 1.1, we can reconstruct the convex hull of \( D \). It is worth mentioning that using other CGO solutions, as it is proposed in [22], we can reconstruct parts of the non-convex part of \( D \).

Before we discuss more Theorem 1.1 let us recall that the idea of using CGO solutions for reconstructing interfaces goes back to [3] where the acoustic case has been considered, see also [7] and the references therein. We should also mention the works [5], [14], [15] and [21] where different CGOs were used for both the impenetrable and the penetrable obstacles in the acoustic case. Corresponding results for the Lamé model with zero frequencies are given in [5] and [19].

Regarding the Maxwell case, Theorem 1.1 has been already proved for the impenetrable case in [22]. Our contribution in this paper is twofold.

The first contribution concerns the impenetrable case. We prove Theorem 1.1 with only Lipschitz regularity assumption on \( \partial D \), but most importantly we impose no restriction on the directions \( \rho \in S^2 \), while in [22] a countable set of such directions has to be avoided. This last restriction is not natural and it is related to the geometrical assumption on the positivity of lower bound of the curvature of the obstacle’s surface. Such an assumption was already used in the previous works concerning the acoustic case, see [6] and [15] for instance. In [17], see also [18], this assumption has been removed by proving a natural estimate of the so-called reflected solution. This estimate is obtained by using invertibility properties related to the layer potentials in the Sobolev spaces \( H^s(\partial D), s \in [-1, 1] \). In this current work, we generalize this technique to the Maxwell’s model, in the corresponding spaces \( X^{-1/2}_{-p,p}, p < 2 \), near 2, see Section 2 for more details on these spaces, and we prove the needed estimate, see Proposition 2.2, with which we can avoid the mentioned geometrical assumptions.

The second contribution of this paper is to justify Theorem 1.1 for the penetrable case. In this case also one needs an appropriate estimate of the corresponding reflected solution. In the acoustic case, see [17], the analysis is based on the celebrated Meyers’s \( L^p \) estimate of the gradient of the solutions of scalar divergence form elliptic equations to provide a natural estimate of this reflected solution. Similar as in the impenetrable case, this estimate helps to avoid the apriori geometrical assumption of \( \partial D \) used in the previous works, see for instance [14]. Following this technique, we first prove a global \( L^p \) estimate for the curl of the solutions of the Maxwell equations, for \( p \) near 2 and \( p \leq 2 \), in the spirit of Meyers’s result, and then use it to provide the corresponding estimate which helps justifying Theorem 1.1 with no geometrical assumption and assuming minimum regularity on the interface \( \partial D \) and the coefficient \( \mu \).

We want to emphasize that this \( L^p \) estimate is of importance for itself since it can be used for other purposes. A detailed discussion about this issue is given in Section 4. Let us mention here the \( L^p \) regularity of the solution of the Maxwell’s system, shown in [1], see also the references therein, where \( \mu \) is taken as a constant and \( \epsilon \) is piecewise constant. They derive an estimate of the magnetic field \( H \) in the \( W^{1,p}(\Omega)\)-norm in terms of its \( L^p(\Omega)\)-norm and the data, for every \( p, p \in (1, \infty) \). This means that the solution operator can be a bijection, however it is not necessary an isomorphism. The estimate we obtain here, where \( \mu \) is taken in \( L^\infty(\Omega) \) and \( \epsilon \) constant, shows that this solution operator is an isomorphism on the spaces \( H^{1,p}(\text{curl}; \Omega) \) but for \( p \) near 2 and \( p \leq 2 \). This last property is important to our analysis of the enclosure method. Other regularity results can be found in [20] where a global estimate in the Campanato spaces are given and then a Hölder regularity estimate is shown.

The paper is organized as follows. In Section 2, we deal with the impenetrable case and in Section 3, we consider the penetrable obstacle case. In Section 4, we establish the global \( L^p \) estimate for the curl of the solutions of the Maxwell’s equations while in Section 5, as an Appendix, we recall some important properties related to the Layer potentials and the Sobolev spaces appearing in the study of problems related to the Maxwell equations as well as the proof of some technical results used in Section 2.
2 Proof of Theorem 1.1 for the impenetrable case

We give the proof for the second point (1.8), since it is the most difficult part. The other points are easy to obtain by the identity \( I_ρ(τ, t) = e^{2τ h_0(ρ)−τ} I_ρ(τ, h_D(ρ)) \) and (1.8). In addition, the lower estimate in (1.8) is the most difficult part since the upper bound is easy due to the well-posedness of the forward problem. So, our focus is on the lower order estimate. Let us recall the integration by parts formula from [12, Theorem 3.29 and Theorem 3.31]. For any \( v ∈ H(\text{curl}; Ω) \) and \( \varphi ∈ (H^1(Ω))^3 \), the following Green’s theorem holds.

\[
\int_Ω (\text{curl} v) \cdot ϕ dx - ∫_Ω v · (\text{curl} ϕ) dx = ∫_{∂Ω} (ν ∧ v) · ϕ ds(y).
\] (2.1)

In the other hand, for any \( v ∈ H(\text{curl}; Ω) \) and \( \varphi ∈ H(\text{curl}; Ω) \), we have

\[
\int_Ω (\text{curl} v) · ϕ dx - ∫_Ω v · (\text{curl} ϕ) dx = ∫_{∂Ω} (ν ∧ v) · (ν ∧ ϕ) ds(y).
\] (2.2)

We start by the following lemma.

Lemma 2.1. Assume \((E, H) ∈ H(\text{curl}; Ω \setminus D) × H(\text{curl}; Ω \setminus D)\) is a solution of the problem

\[
\begin{cases}
\text{curl} E - ikH = 0 & \text{in } Ω \setminus D, \\
\text{curl} H + ikE = 0 & \text{in } Ω \setminus D, \\
ν ∧ E = f & \text{in } TH^{-\frac{1}{2}}(∂Ω) \text{ on } ∂Ω, \\
ν ∧ H = 0 & \text{on } ∂D,
\end{cases}
\] (2.3)

with \( f = ν ∧ E_0|_{∂Ω} \). Then we have the identity,

\[
-\frac{1}{τ} I_ρ(τ, t) = -∫_D \{ |\text{curl} E_0(x)|^2 - k^2 |E_0(x)|^2 \} dx - ∫_{Ω \setminus D} \{ |\text{curl} \hat{E}(x)|^2 - k^2 |\hat{E}(x)|^2 \} dx
\]

\[
= ∫_D \{ |\text{curl} H_0(x)|^2 - k^2 |H_0(x)|^2 \} dx + ∫_{Ω \setminus D} \{ |\text{curl} \hat{H}(x)|^2 - k^2 |\hat{H}(x)|^2 \} dx
\]

and then the inequality

\[
-\frac{1}{τ} I_ρ(τ, t) ≥ ∫_D \{ |\text{curl} H_0(x)|^2 - k^2 |H_0(x)|^2 \} dx - k^2 ∫_{Ω \setminus D} |\hat{H}(x)|^2 dx,
\] (2.4)

where \( \hat{E} := E - E_0 \) and \( \hat{H} := H - H_0 \).

Proof. It is based on integration by parts, see Lemma 4.4 of [22] for details, keeping in mind that we use here the integration by parts formula (2.2) since \( E, H ∈ H(\text{curl}; Ω \setminus D) \).

Using (2.4), we remark that it is enough to dominate the lower order term \( ∫_{Ω \setminus D} |\hat{H}(x)|^2 dx \) by the terms involving only \( H_0 \). Then from the explicit form of \( H_0 \), we deduce Theorem 1.1. This is the object of the next subsection. For this, we need the following extra condition on the wave number \( k \). Namely, we assume that \( k \) is not a Maxwell eigenvalue\(^1\) in \( D \), i.e. if \( E, H ∈ H(\text{curl}; D) \) satisfy

\[
\begin{cases}
\text{curl} E - ikH = 0 & \text{in } D, \\
\text{curl} H + ikE = 0 & \text{in } D, \\
ν ∧ E = 0 & \text{on } ∂D,
\end{cases}
\]

then \( E = H = 0 \) in \( D \).

\(^1\)This condition is needed because, for simplicity, we used the single layer potential representation (2.7). It can be removed if we use combined single and double layer representations.
2.1 Estimates of the lower order term $\tilde{H}$

The aim is to prove the following estimate.

**Proposition 2.2.** Let $\Omega$ be $C^1$-smooth and $D, D \subset \Omega$, be Lipschitz. Then, there exists a positive constant $C$ independent on $(\tilde{E}, \tilde{H})$ and $(E_0, H_0)$ such that

$$\int_{\Omega \setminus D} |\tilde{H}(x)|^2 dx \leq C \{ \| \text{curl} H_0 \|^2_{L_p(D)} + \| H_0 \|^2_{H^{1/2}(D)} \},$$

(2.5)

for all $p$ and $s$ such that $\max \{ 2 - \delta, 4/3 \} < p \leq 2$ and $0 < s \leq 4$ with $\delta > 0$.

**Proof.** Step 1. Let $E^{ex}, H^{ex}$ be the solution of the following well posed exterior problem, see [11, 12].

$$\begin{cases}
\text{curl} E^{ex} - ik H^{ex} = 0 & \text{in } \mathbb{R}^3 \setminus \overline{D}, \\
\text{curl} H^{ex} + ik E^{ex} = 0 & \text{in } \mathbb{R}^3 \setminus \overline{D}, \\
\nu \wedge H^{ex} = -\nu \wedge H_0 & \text{on } \partial D, \\
E^{ex}, H^{ex} & \text{satisfy the Silver-Müller radiation condition.}
\end{cases}$$

(2.6)

We represent these solutions $E^{ex}$ and $H^{ex}$ by the following layer potentials

$$H^{ex}(x) := \text{curl} \int_{\partial D} \Phi_k(x, y)f(y)ds(y),$$

$$E^{ex}(x) := -\frac{1}{ik} \text{curl} H^{ex}(x), \ x \in \mathbb{R}^3 \setminus \partial D,$$

(2.7)

where $\Phi_k(x, y) := \frac{-e^{ik|x-y|}}{4\pi|x-y|}, \ x, y \in \mathbb{R}^3, \ x \neq y$, is the fundamental solution of the Helmholtz equation and $f$ is the density. Note that (2.7) satisfy the first two equations and the radiation condition of (2.6). By using the jump formula of the curl of the single layer potential on $\partial D$ with $X^{-1/p,p}_{\partial D}$ densities, see [11], where the space $X^{-1/p,p}_{\partial D} \subset L^p_{\text{tan}}(\partial D)$ is defined as

$$X^{-1/p,p}_{\partial D} := \{ A \in L^p_{\text{tan}}(\partial D); \text{Div} A \in W^{-1/p,p}(\partial D) \}$$

with the norm $\| A \|_{X^{-1/p,p}_{\partial D}} := \| A \|_{L^p(\partial D)} + \| \text{Div} A \|_{W^{-1/p,p}(\partial D)}$, we obtain

$$\nu \wedge H^{ex} = (-\frac{1}{2}I + M_k)f,$$

(2.8)

where $M_k$ is defined as

$$(M_kf)(x) := \nu \wedge p.v. \text{curl} \int_{\partial D} \Phi_k(x, y)f(y)ds(y), \ x \in \partial D.$$  

Hence $f$ is solution of the equation

$$(-\frac{1}{2}I + M_k)f = -\nu \wedge H_0.$$

(2.9)

We need the following lemma for our analysis.

**Lemma 2.3** (Theorem 5.3 of [11]). Let $D$ be a bounded Lipschitz domain in $\mathbb{R}^3$ with $\mathbb{R}^3 \setminus \overline{D}$ is connected. There exists $\delta$ positive and depending only on $\partial D$ such that, if $k \in \mathbb{C} \setminus \{0\}, Im k \geq 0$, is not a Maxwell eigenvalue for $D$, then the following operator is isomorphism

$$(-\frac{1}{2}I + M_k) : X^{-1/p,p}_{\partial D} \rightarrow X^{-1/p,p}_{\partial D}$$

for each $2 - \delta \leq p \leq 2 + \delta$.

\(^2\)To extend this result to $s = 0$, we need the trace theorem between $H^{1/2}(D)$ and $L^2(\partial D)$. However, this trace theorem is not necessarily valid for Lipschitz domains, see for instance [9, p 209].
Let us recall the Sobolev-Besov space $B_{1,2}^{p,2}(\Omega \setminus \overline{D}) = [L^p(\Omega \setminus \overline{D}), W^{1,p}(\Omega \setminus \overline{D})]_{1,2}$, see Appendix A for a general setting and \cite{13, 13} for more details. The embedding $i : B_{1,2}^{p,2}(\Omega \setminus \overline{D}) \to L^2(\Omega \setminus \overline{D})$ is bounded for $4/3 < p \leq 2$, see for instance \cite[Theorem 2]{13}. Using this embedding and Property 5 in Appendix, we obtain

$$
\|H^{ex}\|_{L^2(\Omega \setminus \overline{D})} \leq C\|H^{ex}\|_{B_{1,2}^{p,2}(\Omega \setminus \overline{D})} \leq C\{\|\nu \wedge H^{ex}\|_{L^p(\partial D)} + \|\nu \wedge H^{ex}\|_{L^p(\partial D)} + \|H^{ex}\|_{L^p(\Omega \setminus \overline{D})} + \|E^{ex}\|_{L^p(\Omega \setminus \overline{D})}\}. \tag{2.10}
$$

We denote the single layer potential by $S_k$

$$
S_k f(x) := \int_{\partial D} \Phi_k(x, y) f(y) ds(y), \quad x \in \mathbb{R}^3 \setminus \partial D.
$$

The operator $S_k : W^{-1/p,p}(\partial D) \to W^{1,p}(\Omega \setminus \overline{D})$ is bounded, see Property 1 in Appendix. Hence

$$
\|H^{ex}\|_{L^p(\Omega \setminus \overline{D})} = \|\text{curl} \ S_k f\|_{L^p(\Omega \setminus \overline{D})} \leq C \|f\|_{W^{-1/p,p}(\partial D)} \leq C \|f\|_{L^p(\partial D)} \tag{2.11}.
$$

Now using the identity $\text{curl} \ \text{curl} \ S_k f = \nabla \text{div} \ S_k f - \Delta S_k f = \nabla S_k(\text{Div} f) + k^2 S_k f$ and the above properties of the single layer potential, we obtain

$$
\|E^{ex}\|_{L^p(\Omega \setminus \overline{D})} \leq C \|\text{curl} \ \text{curl} \ S_k f\|_{L^p(\Omega \setminus \overline{D})} \leq C[\|\nabla S_k(\text{Div} f)\|_{L^p(\Omega \setminus \overline{D})} + \|S_k f\|_{L^p(\Omega \setminus \overline{D})}] \leq C[\|\text{Div} f\|_{W^{-1/p,p}(\partial D)} + \|f\|_{W^{-1/p,p}(\partial D)}] \leq C[\|\text{Div} f\|_{W^{-1/p,p}(\partial D)} + \|f\|_{L^p(\partial D)}]. \tag{2.12}
$$

Also, since $\overline{D} \subset \subset \Omega$ we have

$$
\|\nu \wedge H^{ex}\|_{L^p(\partial D)} \leq C\left(\int_{\partial D} \left(\int_{\partial D} \text{curl}_z \Phi_k(x, y) f(y) ds(y)\right)^p ds(x)\right)^{1/p} \leq C \|f\|_{L^p(\partial D)}. \tag{2.13}
$$

Combining the estimates \text{(2.10)}, \text{(2.11)}, \text{(2.12)}, \text{(2.13)} and the fact that $\nu \wedge H^{ex} = -\nu \wedge H_0$ on $\partial D$, we have

$$
\|H^{ex}\|_{L^2(\Omega \setminus \overline{D})} \leq C\|\nu \wedge H_0\|_{L^p(\partial D)} + C\|f\|_{L^p(\partial D)} + \|\text{Div} f\|_{W^{-1/p,p}(\partial D)}. \tag{2.14}
$$

Using the invertibility of the operator $-\frac{1}{2} I + M_k$, see Lemma 2.3 from the equation \text{(2.9)}, we obtain

$$
\|f\|_{L^p(\partial D)} + \|\text{Div} f\|_{W^{-1/p,p}(\partial D)} \leq C[\|\nu \wedge H_0\|_{L^p(\partial D)} + \|\text{Div} (\nu \wedge H_0)\|_{W^{-1/p,p}(\partial D)}]. \tag{2.15}
$$

Hence from Property 2 and Property 3 of Theorem 5.1 in Appendix together with the estimates \text{(2.14)} and \text{(2.15)} we obtain

$$
\|H^{ex}\|_{L^p(\Omega \setminus \overline{D})} \leq C[\|\nu \wedge H_0\|_{L^p(\partial D)} + \|\text{curl} H_0\|_{L^p(D)}], \quad 4/3 < p \leq 2. \tag{2.16}
$$

**Step 2.** Define $\mathcal{E} := \hat{E} - E^{ex}$ and $\mathcal{H} := \hat{H} - H^{ex}$, then $\mathcal{E}$ and $\mathcal{H}$ satisfy the following Maxwell problem

$$
\begin{cases}
\text{curl} \mathcal{E} - ik \mathcal{H} = 0 \quad \text{in} \quad \Omega \setminus \overline{D}, \\
\text{curl} \mathcal{H} + ik \mathcal{E} = 0 \quad \text{in} \quad \Omega \setminus \overline{D}, \\
\nu \wedge \mathcal{H} = 0 \quad \text{on} \quad \partial D, \\
\nu \wedge \mathcal{E} = -\nu \wedge E^{ex} \quad \text{on} \quad \partial \Omega.
\end{cases} \tag{2.17}
$$

Applying the $L^2$-theory for the Maxwell system, we obtain

$$
\|\mathcal{H}\|_{L^2(\Omega \setminus \overline{D})} \leq \|\mathcal{E}\|_{H(\text{curl}; \Omega \setminus \overline{D})} \leq C\|\nu \wedge \mathcal{E}\|_{H^{-1/2}(\partial D)} \leq C\|\nu \wedge E^{ex}\|_{H^{-1/2}(\partial D)} \leq C\|\nu \wedge E^{ex}\|_{H^{-1/2}(\partial D)}. \tag{2.18}
$$
For \( x \in \partial \Omega \) and \( y \in \partial D \), the fundamental solution \( \Phi_k(x, y) \) is a smooth function. Therefore from (2.7), we have

\[
|_{H^{-1/2}(\partial \Omega)} \nu \wedge E^{ex}(x) | = | \int_{\partial \Omega} (\nu(x) \wedge E^{ex}(x)) \varphi(x) ds(x) |
\]

\[
= | \int_{\partial \Omega} \int_{\partial D} (\nu(x) \wedge \text{curl}_\nu \Phi_k(x, y)) f(y) \varphi(x) ds(y) ds(x) |
\]

\[
\leq \int_{\partial \Omega} \int_{\partial D} |\nu(x) \wedge \text{curl}_\nu \Phi_k(x, y)||f(y)||\varphi(x)| ds(y) ds(x)
\]

\[
\leq C \left( \int_{\partial D} |f(y) ds(y)\right) \left( \int_{\partial \Omega} |\varphi(x)| ds(x) \right)
\]

\[
\leq C \|f\|_{L^p(\partial D)} \|\nu\|_{H^{1/2}(\partial \Omega)}
\]

Taking the supremum over all \( \varphi \) with \( \|\varphi\|_{H^{1/2}(\partial \Omega)} \leq 1 \) on the above estimate, we get

\[
\|\nu \wedge E^{ex}\|_{H^{-1/2}(\partial \Omega)} \leq C \|f\|_{L^p(\partial D)}, \quad \forall p \geq 1.
\] (2.19)

From (2.18) and (2.19) together with Lemma 2.3 and (2.9), we obtain

\[
\|\mathcal{H}\|_{L^2(\Omega, \mathbb{D})} \leq C[\|f\|_{L^p(\partial D)} + \|\text{Div} f\|_{W^{-1, p}(\partial D)}]
\]

\[
\leq C[\|\nu \wedge H_0\|_{L^p(\partial D)} + \|\text{Div}(\nu \wedge H_0)\|_{W^{-1, p}(\partial D)}]
\]

\[
\leq C[\|\nu \wedge H_0\|_{L^p(\partial D)} + \|\text{curl} H_0\|_{L^p(D)}], \quad 2 - \delta \leq p \leq 2 + \delta.
\] (2.20)

Combining (2.16) and (2.20), we obtain

\[
\int_{\Omega \setminus \mathbb{D}} |\tilde{H}(x)|^2 dx \leq \|\mathcal{H}\|_{L^2(\Omega \setminus \mathbb{D})}^2 + \|H^{ex}\|_{L^2(\Omega \setminus \mathbb{D})}^2
\]

\[
\leq C[\|\nu \wedge H_0\|_{L^p(\partial D)}^2 + \|\text{curl} H_0\|_{L^p(D)}^2],
\]

for all \( 2 - \delta, 4/3 < p \leq 2 \). As, for \( s > 0 \) and \( p \leq 2 \) we have \( H^s(\partial D) \subset L^2(\partial D) \subset L^p(\partial D) \), then we deduce that

\[
\|\nu \wedge H_0\|_{L^p(\partial D)} \leq C\|H_0\|_{L^p(\partial D)} \leq C\|H_0\|_{H^{1,s}(\partial D)}.
\]

Note that the trace map \( \gamma: H^{s+1/2}(D) \rightarrow H^s(\partial D), \quad 0 < s \leq \frac{4}{3} \), defined by \( \gamma(u) = u|_{\partial D} \), is bounded. So the estimate (2.21) becomes

\[
\int_{\Omega \setminus \mathbb{D}} |\tilde{H}(x)|^2 dx \leq C[\|H_0\|_{H^{s+1/2}(D)}^2 + \|\text{curl} H_0\|_{L^p(D)}^2],
\] (2.22)

for all \( 2 - \delta, 4/3 < p \leq 2 \) with \( \delta > 0 \) and \( 0 < s \leq 1 \).

\[\square\]

### 2.2 Proof of Theorem 1.1

Here, we use the same notations as in the previous works [6,13] and [15] for instance. Let us first introduce the sets \( D_{j, \delta} \subset D, D_\delta \subset D \) as follows. For any \( \alpha \in \partial D \cap \{ x \cdot \rho = h_D(\rho) \} = K \), we define \( B(\alpha, \delta) := \{ x \in \mathbb{R}^3 ; |x - \alpha| < \delta \} \). Then, \( K \subset \bigcup_{\alpha \in K} B(\alpha, \delta) \). Since \( K \) is compact, there exist \( \alpha_1, \cdots, \alpha_n \) such that \( K \subset B(\alpha_1, \delta) \cup \cdots \cup B(\alpha_n, \delta) \). Then we define \( D_{j, \delta} := D \cap B(\alpha_j, \delta), D_\delta := \bigcup_{j=1}^n D_{j, \delta} \).

\[
\int_{D \setminus D_\delta} e^{-\tau(h_D(\rho) - x \cdot \rho)} dx = O(e^{-\tau \rho}) \quad (\tau \to \infty),
\]

\[\text{This is the place where we used the trace theorem for Lipschitz domain and we need to avoid } s = 0.\]
with positive constant $c$. Let $\alpha_j \in K$. By a rotation and translation, we may assume that $\alpha_j = 0$ and the vector $\alpha_j - x_0 = 0$ is parallel to $e_3 = (0, 0, 1)$. Then, we consider a change of coordinate near $\alpha_j$:

$$y' = x', y_3 = h_D(\rho) - x \cdot \rho,$$

where $x' = (x_1, x_2), y' = (y_1, y_2), x = (x', x_3), y = (y', y_3)$. Denote the parametrization of $\partial D$ near $\alpha_j$ by $l_j(y')$.

**Lemma 2.4.** For $1 \leq q < \infty$, The following estimates hold.

1. 

$$\int_D |H_0(x)|^q dx \leq C \sum_{j=1}^n \int_{|y'|<\delta} e^{-q\tau l_j(y')} dy' - \frac{C}{q} \tau^{-1} e^{-q\delta \tau} + Ce^{-q\tau}$$

2. 

$$\int_D |H_0(x)|^2 dx \geq C \sum_{j=1}^n \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' - \frac{C}{2} \tau^{-1} e^{-2\delta \tau}$$

3. 

$$\int_D |\text{curl} H_0(x)|^q dx \leq C \tau^{-1} \sum_{j=1}^n \int_{|y'|<\delta} e^{-q\tau l_j(y')} dy' - \frac{C}{q} \tau^{-1} e^{-q\delta \tau} + C e^{-q\tau}$$

4. 

$$\int_D |\text{curl} H_0(x)|^2 dx \geq C \tau \sum_{j=1}^n \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' - \frac{C}{2} \tau^{-1} e^{-2\delta \tau}.$$

**Proof.** We only give the proofs for the points 1. and 2. Recall that, for $t > 0$ we are considering the CGO solutions as follows.

$$\begin{cases}
E_0 := e^{\theta(x_0, t) + \sqrt{\tau^2 + k^2} x \cdot \rho}
H_0 := e^{\theta(x_0, t) + i\sqrt{\tau^2 + k^2} x \cdot \rho - \tau - q\delta \tau}
\end{cases}$$

(2.28)

where $\eta = \mathcal{O}(\tau)$ and $\theta = \mathcal{O}(1)$, for $\tau > 1$.

1. 

\[ \int_D |H_0(x)|^q dx = \int_D e^{-q\tau (\rho H_D - x \cdot \rho)} |\theta|^q dx \]

\[ \leq C \int_D e^{-q\tau (\rho H_D - x \cdot \rho)} dx \]

\[ = \int_{D_\delta} e^{-q\tau (\rho H_D - x \cdot \rho)} dx + \int_{D \setminus D_\delta} e^{-q\tau (\rho H_D - x \cdot \rho)} dx \]

\[ \leq C \sum_{j=1}^n \int_{|y'|<\delta} dy' \int_{l_j(y')} e^{-q\tau y_3} dy_3 + C e^{-q\tau} \]

\[ = C \tau^{-1} \sum_{j=1}^n \int_{|y'|<\delta} e^{-q\tau l_j(y')} dy' - \frac{C}{q} \tau^{-1} e^{-q\delta \tau} + C e^{-q\tau}. \]

2. 

\[ \int_D |H_0(x)|^2 dx = \int_D e^{-2\tau (\rho H_D - x \cdot \rho)} |\theta|^2 dx \]
Proof. Using the Hölder inequality with exponent

\[ \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' \geq C \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau |y'|} dy' \geq C \tau^{-2} \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2|y'|} dy' = O(\tau^{-2}), \quad (2.30) \]

since we have \( l_j(y') \leq C|y'| \) if \( \partial D \) is Lipschitz. Now using Lemma 2.4 we obtain

\[ \frac{\| \text{curl} H_0 \|^2_{L^2(D)}}{\| H_0 \|^2_{L^2(D)}} \geq \frac{C \tau^{-1} \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' - C \tau^{-1} e^{-2\delta\tau} + C e^{-2\tau}}{1 - \frac{C \tau^{-1} \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy'}{1 - \frac{\sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy'}{\sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy'}} = O(\tau^2) \quad (\tau \gg 1). \]

Lemma 2.5. We have the following estimate

\[ \frac{\| H_0 \|^2_{L^2(D)}}{\| \text{curl} H_0 \|^2_{L^2(D)}} \leq O(\tau^{-2}), \quad \tau \gg 1. \quad (2.29) \]

Proof. We have the following estimate

\[ \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' \geq C \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau |y'|} dy' \geq C \tau^{-2} \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2|y'|} dy' = O(\tau^{-2}), \]

Lemma 2.6. For \( p < 2 \), we have the following estimate

\[ \frac{\| \text{curl} H_0 \|^2_{L^p(D)}}{\| H_0 \|^2_{L^2(D)}} \leq C \tau^{1-\frac{2}{p}}, \quad \tau \gg 1. \]

Proof. Using the Hölder inequality with exponent \( q = \frac{2}{p} > 1 \), we have:

\[ \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-p\tau l_j(y')} dy' \leq C \left( \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' \right)^{\frac{2}{p}}. \]

Using Lemma 2.4 and (2.30), we obtain

\[ \frac{\| \text{curl} H_0 \|^2_{L^p(D)}}{\| H_0 \|^2_{L^2(D)}} = \frac{\left( \int_D |\text{curl} H_0(x)|^p dx \right)^{\frac{2}{p}}}{\int_D |H_0(x)|^2 dx} \leq \frac{\tau^{(p-1)\frac{2}{p}} \left( \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-p\tau l_j(y')} dy' \right)^{\frac{2}{p}} + O(\tau^{\frac{2}{p} e^{-2\delta\tau}}) + O(e^{-2\tau})}{\tau \sum_{j=1}^{n} \int_{|y'|<\delta} e^{-2\tau l_j(y')} dy' + O(\tau e^{-2\delta\tau})}. \]
Recall that from Lemma 2.1, we have
\[
\frac{1}{\tau} \sum_{j=1}^{n} \iint_{|y'|<\delta} e^{-2\tau t_j(y')} dy' + \mathcal{O}(e^{-2\delta \tau}) + \mathcal{O}(\tau^{\frac{p}{2}} e^{-2\tau})
\]
\[
\frac{1}{\tau} \sum_{j=1}^{n} \iint_{|y'|<\delta} e^{-2\tau t_j(y')} dy' + \mathcal{O}(e^{-2\delta \tau})
\]
\[
1 + \frac{\mathcal{O}(e^{-2\delta \tau}) + \mathcal{O}(\tau^{\frac{p}{2}} e^{-2\tau})}{\sum_{j=1}^{n} \iint_{|y'|<\delta} e^{-2\tau t_j(y')} dy'}
\]
\[
\leq C \tau^{-\frac{1}{2}} (\tau \gg 1).
\] (2.31)

\[\square\]

Lemma 2.7. If \( t = h_D(\rho) \), then for some positive constant \( C \),
\[
\liminf_{\tau \to \infty} \int_D |\nabla H_0(x)|^2 dx \geq C.
\]

Proof.
\[
\int_D |\nabla H_0(x)|^2 dx \geq C \int_D |E_0(x)|^2 dx
\]
\[
\geq C \tau \sum_{j=1}^{n} \iint_{|y'|<\delta} e^{-2\tau t_j(y')} dy' - \frac{C}{2} \tau e^{-2\delta \tau}
\]
\[
\geq C \tau \sum_{j=1}^{n} \iint_{|y'|<\delta} e^{-2\tau |y'|} dy' - \frac{C}{2} \tau e^{-2\delta \tau}
\]
\[
\geq C \tau \left[ \tau^{-2} \sum_{j=1}^{n} \iint_{|y'|<\tau \delta} e^{-2|y'|} dy' \right] - \mathcal{O}(\tau e^{-2\delta \tau})
\]
\[
\geq C \tau^{-1}, \quad (\tau \gg 1).
\]

Hence
\[
\liminf_{\tau \to \infty} \int_D |\nabla H_0(x)|^2 dx \geq C > 0.
\] \[\square\]

End of the proof of Theorem 1.1
Recall that from Lemma 2.1 we have
\[
-\frac{1}{\tau} I_\rho(t, \tau) \geq \int_D \{ |\nabla H_0(x)|^2 - k^2 |H_0(x)|^2 \} dx - k^2 \int_{\Omega \setminus D} |\tilde{H}(x)|^2 dx.
\]
Now, from Proposition 2.2 we deduce
\[
-\frac{1}{\tau} I_\rho(t, h_D(\rho)) \geq \int_D \{ |\nabla H_0(x)|^2 - k^2 |H_0(x)|^2 \} dx - C[\|H_0\|^{\alpha+1/2}_{L^2(D)} + \|E_0\|_{L^p(D)}^2],
\] (2.32)
where \( 0 < s \leq 1 \) and \( 4/3 < p < 2 \). We now estimate the term \( \frac{\|H_0\|^{\alpha+1/2}_{L^2(D)}}{\|\nabla H_0\|_{L^2(D)}} \), for \( 0 < s \leq 1 \). Set \( t = s + 1/2 \). Then we need to estimate \( \frac{\|H_0\|_{H^{\alpha}(D)}}{\|\nabla H_0\|_{L^2(D)}} \), for \( t \in (\frac{1}{2}, \frac{3}{2}] \). Using the interpolation inequality, we have
\[
\|H_0\|_{H^s(D)} \leq C \|H_0\|_{L^2(D)}^{1-t} \|H_0\|_{H^{\alpha}(D)}^t, \quad 0 \leq t \leq 1.
\]
Recall that $H_0 \in H^1(D)$. From Lemma 2.4 and (2.35), we have the estimate (2.33) becomes

$$\|H_0\|_{H^1(D)}^2 \leq C \left[ \frac{\delta^\alpha}{\alpha} \|H_0\|_{L^2(D)}^2 + \frac{\delta^\beta}{\beta} \|H_0\|_{H^1(D)}^2 \right].$$

Choose $\beta = t^{-1}, 0 < t < 1$. Hence, $\alpha = (1-t)^{-1}, 0 < t < 1$. So, $2(1-t)\alpha = 2$ and $2t\beta = 2$. Then the estimate (2.33) becomes

$$\|H_0\|_{H^1(D)}^2 \leq C \left[ \frac{\delta^{-\alpha}}{\alpha} \|H_0\|_{L^2(D)}^2 + \frac{\delta^{-\beta}}{\beta} \|H_0\|_{H^1(D)}^2 \right] \leq C \left\{ \left( (1-t)\delta^{-1/(1-t)^{-1}} + t\delta^{-1} \right) \|H_0\|_{L^2(D)}^2 + t\delta^{-1} \|\nabla H_0\|_{L^2(D)}^2 \right\}. \tag{2.34}$$

Recall that $H_0 = \theta e^{\tau(x-p-t)+i\sqrt{\tau^2+k^2}x-p^\perp}$, where $\theta = O(1)$, $\tau \gg 1$. Therefore,

$$\frac{\partial H_0}{\partial x_j} = \theta(\tau \rho_j + i \sqrt{\tau^2 + k^2} \rho_j^\perp) e^{\tau(x-p-t)+i\sqrt{\tau^2+k^2}x-p^\perp}.$$ 

Hence

$$\|\nabla H_0\|_{L^2(D)}^2 = \sum_{j=1}^{3} \frac{\partial H_0}{\partial x_j}^2 \|\nabla\|_{L^2(D)}^2 \leq C \sum_{j=1}^{3} \int_D \left[ \tau^2 \rho_j^2 + (\tau^2 + k^2) \rho_j^\perp \right] e^{2\tau(x-p-t)} dx \leq Ct^2 \int_D e^{2\tau(x-p-t)} dx.$$ 

For $t = h_D(\rho)$, we obtain

$$\|\nabla H_0\|_{L^2(D)}^2 \leq Ct^2 \int_D e^{-2\tau(h_D(\rho)-x-p)} dx \leq Ct^2 \left( \int_{D_{h_D(\rho)}} + \int_{D \setminus D_{h_D(\rho)}} \right) e^{-2\tau(h_D(\rho)-x-p)} dx \leq C t^2 \sum_{j=1}^{n} \int_{|y'| < \delta} \int_{l_j(y') \setminus \{y\}} e^{-2\tau y^3} dy_3 + C \tau^2 e^{-2\tau}$$

$$\leq C \tau \sum_{j=1}^{n} \int_{|y'| < \delta} e^{-2\tau l_j(y')} dy' - \frac{C}{2} \tau e^{-2\tau} + Ct^2 e^{-2\tau}. \tag{2.35}$$

From Lemma 2.3 and (2.35), we have

$$\frac{\|\nabla H_0\|_{L^2(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}^2} \leq C. \tag{2.36}$$

Hence from (2.29) together with (2.34) and (2.36) we obtain

$$\frac{\|H_0\|_{H^1(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}^2} \leq C \left\{ \left( (1-t)\delta^{-1/(1-t)^{-1}} + t\delta^{-1} \right) \frac{\|H_0\|_{L^2(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}^2} + t\delta^{-1} \frac{\|\nabla H_0\|_{L^2(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}^2} \right\} \leq C \left\{ (1-t)\delta^{-1/(1-t)^{-1}} + t\delta^{-1} \right\} O(\tau^{-2}) + Ct\delta^{-1}. \tag{2.37}$$
We now choose $p$ such that $\max\{2 - \delta, 4/3\} < p < 2$. Combining (2.32) and (2.37) together with Lemma 2.6 and Lemma 2.7, we obtain

\begin{align*}
\frac{-\frac{1}{2}I_\rho(\tau, h_D(\rho))}{\|\text{curl} H_0\|_{L^2(D)}} &\geq C - c_1 \frac{\|H_0\|_{L_2(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}} - c_2 \frac{\|H_0\|_{H^1(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}} - c_3 \frac{\|\text{curl} H_0\|_{L^2(D)}^2}{\|\text{curl} H_0\|_{L^2(D)}} \\
&\geq C - c_1 \left\{ (1 - t)\delta^{-1} + t\delta^{-1} - 1 \right\} \mathcal{O}(\tau^2) - c_2 t\delta^{-1} - c_3 \tau^{-\frac{2}{p}} \\
&\geq C - c_2 t\delta^{-1}, \quad 1/2 < t < 1, \quad \tau \gg 1. \tag{2.38}
\end{align*}

Now, we fix $t$ in $(1/2, 1)$ and choose $\delta > 0$ such that $C - c_2 t\delta^{-1} > c > 0$, then the estimate (2.38) becomes

\begin{align*}
\frac{-\frac{1}{2}I_\rho(\tau, h_D(\rho))}{\|\text{curl} H_0\|_{L^2(D)}} &\geq c > 0, \quad \tau \gg 1.
\end{align*}

Hence form Lemma 2.7 we obtain

\begin{align*}
\liminf_{\tau \to \infty} |I_\rho(\tau, h_D(\rho))| &\geq c > 0.
\end{align*}

### 3 Proof of Theorem 1.1 for the penetrable case

In this section, we prove our main theorem for the penetrable obstacle case. For a wave number $k > 0$, electric permittivity $\epsilon > 0$ and magnetic permeability $\mu > 0$, consider the penetrable obstacle problem as follows

\begin{equation}
\begin{aligned}
\text{curl} E - ik\mu H &= 0 \quad \text{in} \ \Omega, \\
\text{curl} H + ike E &= 0 \quad \text{in} \ \Omega, \\
\nu \wedge E &= f \quad \text{on} \ \partial \Omega,
\end{aligned}
\tag{3.1}
\end{equation}

where $k$ is not an eigenvalue of the spectral problem corresponding to (3.1). Recall that, in this section we use the CGO solutions of the form

\begin{equation}
\begin{aligned}
e_{\epsilon} := \eta_{\epsilon} \epsilon^{(x - \rho - t) + i\sqrt{\tau^2 - k^2} x \cdot \rho^+}, \\
H_0 := \theta_{\epsilon} \epsilon^{(x - \rho - t) + i\sqrt{\tau^2 - k^2} x \cdot \rho^+},
\end{aligned}
\tag{3.2}
\end{equation}

where $\eta = \mathcal{O}(1)$ and $\theta = \mathcal{O}(\tau)$ for all $\tau \gg 1$ and $t > 0$. Let $\tilde{E} = E - E_0$ be the reflected solution. It satisfies the following problem

\begin{equation}
\begin{aligned}
\text{curl} \left( \frac{1}{\mu(x)} \right) \text{curl} \tilde{E} - \mu(x)\epsilon(x)\tilde{E} = -\text{curl} \left( \frac{1}{\mu(x)} \right) \text{curl} E_0 + \mu(x)\epsilon(x) - 1 \text{curl} E_0 \quad \text{in} \ \Omega, \\
\nu \wedge \tilde{E} &= 0 \quad \text{on} \ \partial \Omega.
\end{aligned}
\tag{3.3}
\end{equation}

**Lemma 3.1.** We have the estimates

\begin{align*}
-\tau^{-1}I_{\rho}(\tau, t) \geq &\int_D (1 - \mu(x)) |\text{curl} E_0(x)|^2 dx - k^2 \int_\Omega |\tilde{E}(x)|^2 dx - k^2 \int_D (\epsilon(x) - 1)|E(x)|^2 dx, \\
\text{and} \quad \tau^{-1}I_{\rho}(\tau, t) \geq &\int_D (1 - \mu(x)) |\text{curl} E_0(x)|^2 dx - k^2 \int_\Omega \epsilon(x)|\tilde{E}(x)|^2 dx + k^2 \int_D (\epsilon(x) - 1)|E_0(x)|^2 dx.
\end{align*}

The first inequality will be used if $1 - \mu(x) > 0$ and the second one if $1 - \mu(x) < 0$. 

\[12\]
Proof. Step 1 First we need to prove the following identity
\[
- k^2 \int_\Omega (\epsilon(x) - 1)|E_0(x)|^2 dx + \int_\Omega \left( \frac{1}{\mu(x)} - 1 \right)|\text{curl} E_0(x)|^2 dx \\
+ k^2 \int_\Omega (\epsilon(x)|\tilde{E}(x)|^2 dx - \int_\Omega \frac{1}{\mu(x)}|\text{curl} \tilde{E}(x)|^2 dx \\
= -\tau^{-1} I_p(t, x). \tag{3.4}
\]
Multiplying by \( \tilde{E}(x) \) in the equation \( (3.3) \) and using integration by parts we obtain
\[
\int_\Omega \frac{1}{\mu(x)}|\text{curl} \tilde{E}(x)|^2 dx + \int_\Omega \left( \frac{1}{\mu(x)} - 1 \right) \text{curl} E(x) \cdot (\text{curl} E(x)) dx - k^2 \int_\Omega (\epsilon(x)|\tilde{E}(x)|^2 dx \\
- k^2 \int_\Omega (\epsilon(x) - 1)E_0(x) \cdot \tilde{E}(x) dx = 0,
\]
\[
\int_\Omega \frac{1}{\mu(x)}|\text{curl} \tilde{E}(x)|^2 dx - \int_\Omega \left( \frac{1}{\mu(x)} - 1 \right)|\text{curl} E_0(x)|^2 dx \\
- k^2 \int_\Omega (\epsilon(x)|\tilde{E}(x)|^2 dx + k^2 \int_\Omega (\epsilon(x) - 1)|E_0(x)|^2 dx \\
= k^2 \int_\Omega (\epsilon(x) - 1)E_0(x) \cdot \tilde{E}(x) dx - \int_\Omega \left( \frac{1}{\mu(x)} - 1 \right)(\text{curl} E_0(x)) \cdot (\text{curl} \tilde{E}(x)) dx. \tag{3.5}
\]
On the other hand from equation \( (3.1) \) eliminating \( H(x) \) we have
\[
\text{curl} \left( \frac{1}{\mu(x)} \text{curl} E(x) \right) - k^2 \epsilon E(x) = 0. \tag{3.6}
\]
Then multiplying by \( E_0(x) \) in equation \( (3.6) \) and applying integration by parts we obtain
\[
\int_\Omega \left( \frac{1}{\mu(x)} - 1 \right)(\text{curl} E_0(x)) \cdot (\text{curl} \tilde{E}(x)) dx = k^2 \int_\Omega (\epsilon(x) - 1)E_0(x) \cdot \tilde{E}(x) dx \\
+ \int_{\partial \Omega} (\nu \wedge E_0)(x) \cdot \left( \frac{1}{\mu(x)} \text{curl} \tilde{E}(x) \right) ds(x) - \int_{\partial \Omega} (\nu \wedge \tilde{E})(x) \cdot (\text{curl} E_0(x)) ds(x). \tag{3.7}
\]
Therefore combining \( (3.5) \) and \( (3.7) \) we obtain
\[
\int_\Omega \frac{1}{\mu(x)}|\text{curl} \tilde{E}(x)|^2 dx - \int_\Omega \left( \frac{1}{\mu(x)} - 1 \right)|\text{curl} E_0(x)|^2 dx \\
- k^2 \int_\Omega (\epsilon(x)|\tilde{E}(x)|^2 dx + k^2 \int_\Omega (\epsilon(x) - 1)|E_0(x)|^2 dx \\
= \int_{\partial \Omega} (\nu \wedge E_0)(x) \cdot (\text{curl} E_0(x)) ds(x) - \int_{\partial \Omega} (\nu \wedge \tilde{E})(x) \cdot \left( \frac{1}{\mu(x)} \text{curl} \tilde{E}(x) \right) ds(x) \\
= \int_{\partial \Omega} (\nu \wedge E_0)(x) \cdot (\text{curl} E_0(x)) ds(x) - \int_{\partial \Omega} (\nu \wedge \tilde{E})(x) \cdot \left( \frac{1}{\mu(x)} \text{curl} E_0(x) \right) ds(x) \\
= ik \int_{\partial \Omega} (\nu \wedge E_0)(x) \cdot (\Lambda_D - \Lambda_B)(\nu \wedge E_0)(x) \wedge \nu(x) ds(x) \\
= \tau^{-1} I_p(x). \tag{3.8}
\]
Step 2 Now, we show the following identity
\[
\int_\Omega |\text{curl} \tilde{E}(x)|^2 dx - k^2 \int_\Omega |\tilde{E}(x)|^2 dx - k^2 \int_\Omega (\epsilon(x) - 1)|E(x)|^2 dx + \int_\Omega \left( \frac{1}{\mu(x)} - 1 \right)|\text{curl} E(x)|^2 dx
\]
\[ -k^2 \int_{\Omega} (\varepsilon(x) - 1)|E_0(x)|^2 dx + \int_{\Omega} \left( \frac{1}{\mu(x)} - 1 \right) |\nabla E_0(x)|^2 dx + k^2 \int_{\Omega} \varepsilon(x)|\tilde{E}(x)|^2 dx \]

\[ = -\int_{\Omega} \frac{1}{\mu(x)} |\nabla \tilde{E}(x)|^2 dx. \]

Replacing \( E_0(x) \) by \( E(x) - \tilde{E}(x) \) in the equation (3.3), then we obtain,

\[ \nabla \left( \frac{1}{\mu(x)} - 1 \right) \nabla \tilde{E}(x) + \nabla \nabla \tilde{E}(x) - k^2 \tilde{E}(x) - k^2 (\varepsilon(x) - 1) E(x) = 0. \]  

(3.9)

Multiplying by \( \tilde{E}(x) \) in the equation (3.9) and using integration by parts we obtain,

\[ \int_{\Omega} \left[ \left( \frac{1}{\mu(x)} - 1 \right) \nabla \tilde{E}(x) \right] \cdot (\nabla \tilde{E}(x)) dx + \int_{\Omega} |\nabla \tilde{E}(x)|^2 dx \]

\[ - k^2 \int_{\Omega} |\tilde{E}(x)|^2 dx - k^2 \int_{\Omega} (\varepsilon(x) - 1) E(x) \cdot \tilde{E}(x) dx = 0. \]  

(3.10)

Since, \( \nu \cdot \nabla \tilde{E}(x) = 0 \) on the boundary, then we can write the equation (3.10) as follows

\[ \int_{\Omega} |\nabla \tilde{E}(x)|^2 dx - k^2 \int_{\Omega} |\tilde{E}(x)|^2 dx - k^2 \int_{\Omega} (\varepsilon(x) - 1)|E(x)|^2 dx + \int_{\Omega} \frac{1}{\mu(x)} - 1) |\nabla E(x)|^2 dx \]

\[ = -\int_{\Omega} \left[ \left( \frac{1}{\mu(x)} - 1 \right) \nabla E(x) \right] \cdot (\nabla E(x)) dx - k^2 \int_{\Omega} (\varepsilon(x) - 1) E(x) \cdot \tilde{E}(x) dx + \int_{\Omega} \frac{1}{\mu(x)} - 1) |\nabla E(x)|^2 dx. \]  

(3.11)

Eliminating \( E(x) \) by \( \tilde{E}(x) + E_0(x) \) in (3.11) we get,

\[ = -k^2 \int_{\Omega} (\varepsilon(x) - 1) \tilde{E}(x) \cdot \tilde{E}_0(x) dx - k^2 \int_{\Omega} (\varepsilon(x) - 1)|E_0(x)|^2 dx + \int_{\Omega} \frac{1}{\mu(x)} - 1) (\nabla \tilde{E})(x) \cdot (\nabla \tilde{E}_0)(x) dx \]

\[ + \int_{\Omega} \frac{1}{\mu(x)} - 1) |\nabla E_0(x)|^2 dx. \]  

(3.12)

Again from the equation (3.3) taking complex conjugate, we can write,

\[ \nabla \left( \frac{1}{\mu(x)} - 1 \right) \nabla \tilde{E}(x) + \nabla \nabla \tilde{E}(x) - k^2 \varepsilon(x) \tilde{E}(x) - k^2 (\varepsilon(x) - 1) \tilde{E}_0(x) = 0. \]  

(3.13)

Multiplying by \( \tilde{E}(x) \) in the equation (3.13) and using integration by parts formula the following equality follows

\[ \int_{\Omega} \frac{1}{\mu(x)} |\nabla \tilde{E}(x)|^2 dx + \int_{\Omega} \left( \frac{1}{\mu(x)} - 1 \right) (\nabla \tilde{E}_0(x)) \cdot (\nabla \tilde{E}(x)) dx - k^2 \int_{\Omega} \varepsilon(x)|\tilde{E}(x)|^2 dx \]

\[ - k^2 \int_{\Omega} (\varepsilon(x) - 1) \tilde{E}_0(x) \cdot \tilde{E}(x) dx = 0. \]  

(3.14)

Hence, from the equations (3.12) and (3.14) we can get ,

\[ \int_{\Omega} |\nabla \tilde{E}(x)|^2 dx - k^2 \int_{\Omega} |\tilde{E}(x)|^2 dx - k^2 \int_{\Omega} (\varepsilon(x) - 1)|E(x)|^2 dx + \int_{\Omega} \frac{1}{\mu(x)} - 1) |\nabla E(x)|^2 dx \]

\[ = -k^2 \int_{\Omega} (\varepsilon(x) - 1)|E_0(x)|^2 dx + \int_{\Omega} \frac{1}{\mu(x)} - 1) |\nabla E_0(x)|^2 dx \]

\[ + k^2 \int_{\Omega} \varepsilon(x)|\tilde{E}(x)|^2 dx - \int_{\Omega} \frac{1}{\mu(x)} |\nabla \tilde{E}(x)|^2 dx \]
Combining (3.15) with the formula
\[ |\text{curl} \tilde{E}(x)|^2 + \left( \frac{1}{\mu(x)} - 1 \right) |\text{curl} E(x)|^2 = \frac{1}{\mu(x)} |\text{curl} E(x) - \mu(x)(\text{curl} E_0)(x)|^2 + \left( \frac{1}{\mu(x)} - 1 \right) |\text{curl} E_0(x)|^2 \]
we obtain
\[ -\tau^{-1} I_p(\tau, t) \geq \int_\Omega (1 - \mu(x)) |\text{curl} E_0(x)|^2 dx - k^2 \int_\Omega |\tilde{E}(x)|^2 dx - k^2 \int_\Omega (\epsilon(x) - 1) |E(x)|^2 dx. \tag{3.16} \]
Finally, again from (3.15), we have
\[ \tau^{-1} I_p(\tau, t) \geq \int_D (1 - \frac{1}{\mu(x)}) |\text{curl} E_0(x)|^2 dx - k^2 \int_\Omega \epsilon(x) |\tilde{E}(x)|^2 dx + k^2 \int_D (\epsilon(x) - 1) |E_0(x)|^2 dx. \tag{3.17} \]

3.1 Estimates of the lower order term \( \tilde{E} \)

**Proposition 3.2.** Assume that \( \Omega \) is \( C^1 \)-smooth and \( D \) is a subset strictly included in \( \Omega \). Then there exist a positive constant \( C \) independent of \( \tilde{E} \) and \( E_0 \) and a positive constant \( \delta \) depending only on \( \Omega \) such that we have:
\[ \|\tilde{E}\|_{L^2(\Omega)} \leq C \{ \|\text{curl} E_0\|_{L^p(D)} + \|E_0\|_{L^2(D)} \} \]
for every \( p \) in \( (\max\{\frac{4}{3}, \frac{2+\delta}{1+\delta}\}, 2] \).

**Proof.** Set \( f := -(\frac{1}{\mu(x)} - 1) \text{curl} E_0, \ g := k^2(\epsilon(x) - 1)E_0 \). Then the reflected solution \( \tilde{E} \) satisfies
\[ \begin{cases} \text{curl}(\frac{1}{\mu(x)} \text{curl} \tilde{E}) - k^2 \epsilon(x)\tilde{E} = \text{curl} f + g & \text{in } \Omega, \\ \nu \wedge \tilde{E} = 0 & \text{on } \partial\Omega. \end{cases} \tag{3.18} \]
From the \( L^p \)-estimate, see Theorem 4.5 in Section 4, the following problem
\[ \begin{cases} \text{curl}(\frac{1}{\mu(x)} \text{curl} U) + (\sup_{x\in\Omega} \frac{1}{\mu(x)}) U = \text{curl} f & \text{in } \Omega, \\ \nu \wedge U = 0 & \text{on } \partial\Omega, \end{cases} \tag{3.19} \]
has a unique solution in \( H_0^{1,p}(\text{curl}; \Omega) \) with the estimate
\[ \|U\|_{L^p(\Omega)} + \|\text{curl} U\|_{L^p(\Omega)} \leq C\|f\|_{L^p(\Omega)} \tag{3.20} \]
for \( p \in (\frac{2+\delta}{1+\delta}, 2] \) for some \( \delta > 0 \), depending only on \( \Omega \).

We set \( E = \tilde{E} - U \), then \( E \) satisfies
\[ \begin{cases} \text{curl}(\frac{1}{\mu(x)} \text{curl} E) - k^2 \epsilon(x)E = (k^2 \epsilon(x) + \sup_{x\in\Omega} \frac{1}{\mu(x)}) U + g & \text{in } \Omega, \\ \nu \wedge E = 0 & \text{on } \partial\Omega. \end{cases} \tag{3.21} \]
By the well-posedness of (3.21) in \( H(\text{curl}; \Omega) \), see [12], we obtain
\[ \|E\|_{L^2(\Omega)} + \|\text{curl} E\|_{L^2(\Omega)} \leq C\{ \|U\|_{L^2(\Omega)} + \|g\|_{L^2(\Omega)} \} \]
and in particular, we have for \( p \leq 2 \)
\[ \|E\|_{L^p(\Omega)} + \|\text{curl} E\|_{L^p(\Omega)} \leq C\{ \|U\|_{L^2(\Omega)} + \|g\|_{L^2(\Omega)} \}. \tag{3.22} \]
We recall again the Sobolev-Besov space $B^{p,2}_{\frac{p}{p}}(\Omega)$. Then Property 5 in Appendix A implies that $U \in B^{p,2}_{\frac{p}{p}}(\Omega)$, for $1 < p \leq 2$, since both $U$ and $\text{curl } U$ are in $L^p(\partial \Omega)$ and $\nabla \cdot U = 0$ and $\nu \wedge U = 0$ on $\partial \Omega$. As the inclusion map $B^{p,2}_{\frac{p}{p}}(\Omega) \to L^2(\Omega)$ is continuous for $p \in (\frac{4}{3}, 2)$, see [13, Theorem 2], we have the estimate

$$
\|U\|_{L^2(\Omega)} \leq C\|U\|_{B^{p,2}_{\frac{p}{p}}(\Omega)}.
$$

(3.23)

Again since $\nabla \cdot U = 0$ in $\Omega$ and $\nu \wedge U = 0$ on $\partial \Omega$, then from Property 5 in Appendix together with (3.23) we have

$$
\|U\|_{L^2(\Omega)} \leq C\{\|U\|_{L^p(\Omega)} + \|\text{curl } U\|_{L^p(\Omega)}\}
$$

(3.24)

for $p \in (\frac{4}{3}, 2)$.

Combining (3.20) with (3.22) and (3.24), we obtain

$$
\|\tilde{E}\|_{L^p(\Omega)} + \|\text{curl } \tilde{E}\|_{L^p(\Omega)} \leq C\{\|f\|_{L^p(\Omega)} + \|g\|_{L^2(\Omega)}\}
$$

(3.25)

for $p \in (\max\{\frac{4}{3}, \frac{4\pm q}{1+q}\}, 2)$.

Since $\tilde{E} = \mathcal{E} + U$, then from (3.20) and (3.25) we have

$$
\|\hat{E}\|_{L^p(\Omega)} + \|\text{curl } \hat{E}\|_{L^p(\Omega)} \leq C\{\|f\|_{L^p(\Omega)} + \|g\|_{L^2(\Omega)}\}.
$$

(3.26)

Therefore, recalling again Property 5 in Appendix A and combining it with the inequality (3.23) we have

$$
\|\hat{E}\|_{L^2(\Omega)} \leq C\|\hat{E}\|_{B^{p,2}_{\frac{p}{p}}(\Omega)}
$$

(3.27)

$$
\leq C\{\|\hat{E}\|_{L^p(\Omega)} + \|\text{curl } \hat{E}\|_{L^p(\Omega)} + \|\nabla \cdot \hat{E}\|_{L^p(\Omega)}\}, \text{ since } \hat{E} \wedge \nu = 0.
$$

On the other hand from (3.18), we have $k^2 \nabla \cdot (\epsilon \tilde{E}) = \nabla \cdot g$. Recall that $\nabla \cdot g = k^2\{(\nabla (\epsilon - 1)) \cdot E_0 + (\epsilon - 1)(\nabla \cdot E_0)\}$. However, $\nabla \cdot E_0 = 0$ then, we have $\nabla \epsilon \cdot \tilde{E} + \epsilon (\nabla \cdot \tilde{E}) = \nabla \epsilon \cdot E_0$. Therefore as $\epsilon \in W^{1,\infty}(\Omega)$, we deduce the estimate

$$
\|\nabla \cdot \hat{E}\|_{L^p(\Omega)} \leq \frac{\|\nabla \epsilon\|_{L^\infty(D)}}{\|\epsilon\|_{L^\infty(D)}} \{\|\hat{E}\|_{L^p(\Omega)} + \|E_0\|_{L^p(D)}\}.
$$

(3.28)

Combining the inequalities (3.24), (3.27) and (3.28), we obtain

$$
\|\hat{E}\|_{L^2(\Omega)} \leq C\{\|\hat{E}\|_{L^p(\Omega)} + \|\text{curl } \hat{E}\|_{L^p(\Omega)} + \|E_0\|_{L^p(D)}\}
$$

$$
\leq C\{\|f\|_{L^p(\Omega)} + \|g\|_{L^2(\Omega)} + \|E_0\|_{L^p(D)}\}
$$

$$
\leq C\{\|\text{curl } E_0\|_{L^p(D)} + \|E_0\|_{L^2(D)}\}
$$

for $p \in (\max\{\frac{4}{3}, \frac{4\pm q}{1+q}\}, 2)$.

Note that electric part of the CGO solution defined in (3.28) is nothing but a multiplication by a constant of the magnetic part of the CGO solution defined in (3.22). Then, similarly the magnetic part of the CGO solution defined in (3.25) is nothing but a multiplication by a constant of the electric part of the CGO solution defined in (3.22). So, we have the following lemmas for the CGOs in (3.24) in the same way as we did in Lemma 2.4, Lemma 2.5 and Lemma 2.7.

**Lemma 3.3.** For $1 \leq q < \infty$, The following estimates hold.

1.

$$
\int_D |E_0(x)|^q dx \leq C\tau^{-1} \sum_{\delta} \int_{|y'|<\delta} e^{-q\tau y'(y')} dy' - \frac{C}{q} \tau^{-1} e^{-q\tau} + Ce^{-q\tau}
$$

(3.29)
2. 
\[ \int_D |E_0(x)|^2 dx \geq C \tau^{-1} \sum_{j=1}^n \int_{|y'|<\delta} e^{-2\tau t_j(y')} dy' - C \tau^{-1} e^{-2\delta \tau} \] (3.30)

3. 
\[ \int_D |H_0(x)|^q dx \leq C \tau^{q-1} \sum_{j=1}^n \int_{|y'|<\delta} e^{-q\tau t_j(y')} dy' - C \tau^{q-1} e^{-q\delta \tau} + C \tau^q e^{-q\tau} \] (3.31)

4. 
\[ \int_D |H_0(x)|^2 dx \geq C \tau \sum_{j=1}^n \int_{|y'|<\delta} e^{-2\tau t_j(y')} dy' - C \tau^2 e^{-2\delta \tau}. \] (3.32)

**Lemma 3.4.** We have the following estimate 
\[ \frac{\|H_0\|_{L^2(D)}^2}{\|E_0\|_{L^2(D)}^2} \geq \mathcal{O}(\tau^2), \quad \tau \gg 1. \]

**Lemma 3.5.** If \( t = h_D(\rho) \), then for some positive constant \( C \), 
\[ \liminf_{\tau \to \infty} \tau \int_D |\text{curl} E_0(x)|^2 dx \geq C. \]

**Lemma 3.6.** For \( p \in (\max\{\frac{4}{3}, \frac{2+\delta}{1+\delta}\}, 2] \), we have the following estimates 
\[ \frac{\|\tilde{E}\|_{L^2(\Omega)}^2}{\|\text{curl} E_0\|_{L^2(D)}^2} \leq C \tau^{1-\frac{2}{p}} \quad (\tau \gg 1). \] (3.33)

**Proof.** From Proposition 3.2, we have 
\[ \|\tilde{E}\|_{L^2(\Omega)} \leq C\{\|\text{curl} E_0\|_{L^p(D)} + \|E_0\|_{L^2(D)}\}. \]

Similarly as in the proof of Lemma 2.6, we obtain 
\[ \frac{\|\text{curl} E_0\|_{L^2(D)}^2}{\|\text{curl} E_0\|_{L^2(\Omega)}^2} \leq C \tau^{1-\frac{2}{p}}, \quad \tau \gg 1. \] (3.34)

for all \( p \leq 2 \). Therefore combining Lemma 3.4 and (3.34), we obtain 
\[ \frac{\|\tilde{E}\|_{L^2(\Omega)}^2}{\|\text{curl} E_0\|_{L^2(D)}^2} \leq C \left[ \frac{\|\text{curl} E_0\|_{L^p(D)}^2}{\|\text{curl} E_0\|_{L^2(\Omega)}^2} + \frac{\|E_0\|_{L^2(D)}^2}{\|\text{curl} E_0\|_{L^2(D)}^2} \right] \leq C \{\tau^{1-\frac{2}{p}} + \tau^{-2}\} \leq C \tau^{1-\frac{2}{p}} \quad (\tau \gg 1). \]

**End of the proof of Theorem 1.1**

**Case 1.** \( 1 - \mu(x) > C > 0 \).

From the first inequality in Lemma 3.1 we have 
\[ -I_\rho(\tau, t) \geq \tau \int_D (1 - \mu(x)) |\text{curl} E_0(x)|^2 dx - \tau C \int_\Omega |\tilde{E}(x)|^2 dx - \tau C \int_D |E_0(x)|^2 dx \]
\[ \geq C \tau \int_D |\text{curl} E_0(x)|^2 dx - \tau C \int_\Omega |\tilde{E}(x)|^2 dx - \tau C \int_D |E_0(x)|^2 dx. \]

Using the inequality in Lemma 3.6 and choosing \( p \) in \( \{ \frac{4}{1 + \epsilon}, 2 \} \) we obtain
\[
- I_p(\tau, t) \geq C \tau \left[ 1 - \frac{\int_\Omega |\tilde{E}(x)|^2 dx}{\int_D |\text{curl} E_0(x)|^2 dx} - \frac{\int_D |E_0(x)|^2 dx}{\int_D |\text{curl} E_0(x)|^2 dx} \right] \\
\geq C \tau \left[ 1 - \tau^{1+\epsilon} - 2\tau^{-2} \right].
\]

Hence, using Lemma 3.6 we deduce that for \( \tau \gg 1 \),
\[ |I_p(\tau, h_D(\rho))| \geq C > 0 \]
which ends the proof.

**Case 2.** \( 1 - \mu(x) < -C < 0 \).

Similarly, from the second inequality in Lemma 3.1 we obtain
\[ \tau^{-1} I_p(\tau, t) \geq \int_D (1 - \frac{1}{\mu(x)}) |\text{curl} E_0(x)|^2 dx - k^2 \int_\Omega |\tilde{E}(x)|^2 dx + C \int_D |E_0(x)|^2 dx. \]

Then using the same argument as in **Case 1** we end the proof.

### 4 An \( L^p \)-type estimate for the solutions of the Maxwell system

Let us consider a general time harmonic Maxwell system of equations of the form
\[
\text{curl}(A(x) \text{curl} E(x)) + ME(x) = \text{curl} f(x) + g(x)
\]
(4.1)
where \( A \) is a Hermitian matrix, with measurable entries, satisfying the uniformly ellipticity condition, i.e., there exists positive constants \( \lambda, M \) such that
\[
\lambda|\xi|^2 \leq A(x)\xi \cdot \overline{\xi} \leq M|\xi|^2
\]
for all \( \xi \in \mathbb{C}^3 \) and for almost every \( x \) in \( \Omega \). Let \( \Omega \) be a bounded and \( C^1 \) smooth domain. We recall that the space \( H_0(\text{curl}; \Omega) = \{ E \in L^2(\Omega) : \text{curl} E \in L^2(\Omega), \nu \wedge E = 0 \text{ on } \partial\Omega \} \) is a Banach space under the norm \( \| E \|_{H_0(\text{curl}; \Omega)} := \| E \|_{L^2(\Omega)} + \| \text{curl} E \|_{L^2(\Omega)} \). Now, we define the space \( H^{1, q}_0(\text{curl}; \Omega) := \{ E \in L^q(\Omega) : \text{curl} E \in L^q(\Omega), \nu \wedge E = 0 \text{ on } \partial\Omega \} \) for \( 1 < q < \infty \). The norm of this space is defined as \( \| E \|_{H^{1, q}_0(\text{curl}; \Omega)} := \| E \|_{L^q(\Omega)} + \| \text{curl} E \|_{L^q(\Omega)} \) and an equivalent norm is given by \( \| E \|_{1, q} := (\| E \|^q_{L^q(\Omega)} + \| \text{curl} E \|^q_{L^q(\Omega)})^{\frac{1}{q}} \). Under this second norm, \( H^{1, q}_0(\text{curl}; \Omega) \) is also a Banach space.

The object of this section is to prove that the solution operator corresponding to the problem given by (4.1) in \( H^{1, p}_0(\text{curl}; \Omega) \) is invertible for \( p \) near 2. An idea to prove this property is to use a perturbation argument. Precisely, first we show that in the case \( A = I \), \( I \) is the identity matrix, and \( M = 1 \), this property is true for \( p \) in an interval containing 2 (in our case this interval is \( (1, \infty) \)). Then using an equivalent variational formulation of (4.1) in \( H^{1, p}_0(\text{curl}; \Omega) \) and a perturbation argument, we aim at proving the same property for a general matrix \( A \) but for \( p \) near 2. In the scalar divergence form elliptic problems, these arguments have been successfully applied. There are several methods to justify this perturbation argument. We cite the original one by Meyers, see [10], which works for linear and complex perturbations, i.e., \( A \) is a linear matrix with possibly complex entries. We cite also the method by Gröger, see [3], which works for real valued and nonlinear perturbations of the leading term but justified only for \( p \geq 2 \). Recently the argument of Gröger has been generalized to the elasticity system, see [4]. Here, we generalize the method by Meyers to the Maxwell system to deal with linear perturbations but
allowing \( p \) to be near 2 and \( p \leq 2 \), see Theorem 4.3. It is this last property that is needed in our analysis in Section 3. In [4], other perturbative methods are also discussed.

To start, we define the bilinear form

\[
B_A(E, F) := \int_{\Omega} A(x) \text{curl} E(x) \cdot \text{curl} F(x) dx + M \int_{\Omega} E(x) \cdot F(x) dx,
\]

for all \( E \in H^{1, q}(\text{curl}; \Omega) \) and \( F \in H^{1, q'}(\text{curl}; \Omega) \), where \( \frac{1}{q} + \frac{1}{q'} = 1 \). For \( A(x) = I \), we set \( B := B_A \).

Consider the problem

\[
\text{curl}(A(x) \text{curl} E(x)) + ME(x) = \text{curl} f(x) + g(x) \quad \text{on} \quad \Omega \quad (4.3)
\]

where \( f \) and \( g \) are in \( L^q(\Omega) \), \( q \in (1, +\infty) \).

Recall that \( E \in H^{1, q}(\text{curl}; \Omega) \) is a weak solution of the equation (4.3) if we have

\[
B_A(E, F) = \int_{\Omega} f(x) \cdot \text{curl} F(x) dx + \int_{\Omega} g(x) \cdot F(x) dx \quad (4.4)
\]

for all \( F \in H^{1, q'}(\text{curl}; \Omega) \).

Dividing by \( M \) in both sides of (4.3), we reduce our study to the case \( M = 1 \), i.e. we have

\[
\lambda |\xi|^2 \leq A(x) \xi \cdot \xi \leq |\xi|^2. \quad (4.5)
\]

**4.1 The imperturbed problem**

**Theorem 4.1.** Let \( \Omega \) be a bounded \( C^1 \) domain in \( \mathbb{R}^3 \). Then for \( f \in L^p(\Omega) \) and \( g \in L^p(\Omega) \) with \( 1 < p < \infty \), the boundary value problem

\[
\begin{align*}
\text{curl} \text{curl} E + E &= \text{curl} f + g \quad \text{in} \quad \Omega, \\
\nu \wedge E &= 0 \quad \text{on} \quad \partial \Omega,
\end{align*}
\]

is uniquely weakly solvable and there exists \( C = C(p, k, \Omega) > 0 \) such that,

\[
\|E\|_{L^p(\Omega)} + \|\text{curl} E\|_{L^p(\Omega)} \leq C\{\|f\|_{L^p(\Omega)} + \|g\|_{L^p(\Omega)}\}.
\]

**Proof.** Since the problem related to this Maxwell system is self-adjoint, then \( k = i \) is not a Maxwell eigenvalue. Therefore the rest of the proof follows from Property 6 in Appendix.

Based on Theorem 4.1 we can define the linear transformation \( T_I \) as follows

\[
T_I : L^p(\Omega) \times L^p(\Omega) \rightarrow L^p(\Omega) \times L^p(\Omega) \quad \text{by}
\]

\[
(f, g) \mapsto (\text{curl} E, E) \quad \text{solution of the problem (4.6)}.
\]

We denote its norm by \( \|T_I\|_p \). The next two lemmas give some properties of this norm in terms of \( p \in (1, \infty) \). Note that sometimes we use the notation \( L^p := L^p(\Omega) \) without writing \( \Omega \) to avoid heavy notations.

**Lemma 4.2.** We have \( \|T_I\|_2 = 1 \).

**Proof.** On the one hand, we have

\[
\|T_I\|_2 = \sup_{\|(f, g)\|_{L^2 \times L^2} = 1} \|T_I(f, g)\|_{L^2 \times L^2}
\]

\[
= \sup_{\|(f, g)\|_{L^2 \times L^2} = 1} \|(\text{curl} U_f, U_f)\|_{L^2 \times L^2}
\]

19
On the other hand, 
\[
\|T_i\|_2 = \sup_{\|f, g\|_{L^2 \times L^2} = 1} \sup_{\|f, g\|_{L^2 \times L^2} = 1} \left| \int f(x) \cdot \tilde{f}(x) dx + \int g(x) \cdot \tilde{g}(x) dx \right|
\]
and the Cauchy-Schwarz inequality gives
\[
\|T_i\|_2 \leq \sup_{\|f, g\|_{L^2 \times L^2} = 1} \sup_{\|f, g\|_{L^2 \times L^2} = 1} \left[ \|\text{curl } U^{f, g}\|_{L^2} \|\tilde{f}\|_{L^2} + \|U^{f, g}\|_{L^2} \|\tilde{g}\|_{L^2} \right]
\]
\[
\leq \sup_{\|f, g\|_{L^2 \times L^2} = 1} \left( \frac{1}{2} \left( \|\text{curl } U^{f, g}\|_{L^2}^2 + \|U^{f, g}\|_{L^2}^2 \right) + \frac{1}{2} \right). \tag{4.9}
\]
Given \( f \in L^2(\Omega) \) and \( g \in L^2(\Omega), \) \( U^{f, g} \in H_0^{1,2}(\text{curl}; \Omega) \) is a weak solution of the equation
\[
\text{curl } U^{f, g} + U^{f, g} = \text{curl } f + g,
\]
i.e. it satisfies (4.4) for \( A = I \) and \( q = 2. \) Taking \( E = F = U^{f, g} \) in (4.4), we obtain
\[
\int |\text{curl } U^{f, g}(x)|^2 dx + \int |U^{f, g}(x)|^2 dx = \int f(x) \cdot \text{curl } U^{f, g}(x) dx + \int g(x) \cdot U^{f, g}(x) dx.
\]
By the Cauchy-Schwarz and Young inequalities, we deduce that
\[
\|\text{curl } U^{f, g}\|_{L^2}^2 + \|U^{f, g}\|_{L^2}^2 \leq \|f\|_{L^2}^2 + \|g\|_{L^2}^2. \tag{4.10}
\]
So, (4.9) and (4.10) give
\[
\|T_i\|_2 \leq 1. \tag{4.11}
\]
Finally (4.8) and (4.11) imply
\[
\|T_i\|_2 = 1. \tag{4.12}
\]

The following lemma gives a lower bound of the bilinear form \( \mathcal{B} \) in terms of \( \|T_i\|_p. \)

**Lemma 4.3.** For \( 2 \leq p < \infty, \) we have
\[
\inf_{\|F\|_{1,p} = 1} \sup_{\|E\|_{1,p} = 1} |\mathcal{B}(E, F)| \geq \frac{1}{\|T_i\|_p}. \]
\textbf{Proof.} Let $F \in H_{0}^{1} \cdot \cdot \cdot (\text{curl}; \Omega)$, then
\[
\| (\text{curl} \, F, F) \|_{L^{p'} \times L^{p'}} = \sup_{\| (\tilde{f}, \tilde{g}) \|_{L^{p} \times L^{p}} = 1} |(\text{curl} \, F) \cdot (\tilde{f}, \tilde{g})| = \sup_{\| (\tilde{f}, \tilde{g}) \|_{L^{p} \times L^{p}} = 1} \left| \int_{\Omega} \{ \text{curl} \, F(x) \cdot \tilde{f}(x) + F(x) \cdot \tilde{g}(x) \} \, dx \right|
\]
where we used the fact that $(L^{p}(\Omega) \times L^{p}(\Omega))'$ is isometrically isomorphic to $L^{p'}(\Omega) \times L^{p'}(\Omega)$, see [10], Lemma 4.2, for instance. In addition, for $\tilde{f} \in L^{p}(\Omega)$ and $\tilde{g} \in L^{p}(\Omega)$ there exists a unique $E \in H_{0}^{1}(\text{curl}; \Omega)$ such that (13), with $A = I$, is satisfied. Therefore, using (13) with $A = I$
\[
\| (\text{curl} \, F, F) \|_{L^{p'} \times L^{p'}} = \sup_{\| (\tilde{f}, \tilde{g}) \|_{L^{p} \times L^{p}} = 1} \left| \int_{\Omega} \{ \text{curl} \, E(x) \cdot \tilde{f}(x) + F(x) \cdot \tilde{g}(x) \} \, dx \right|
\]
The boundedness property of $T_{I} : L^{p}(\Omega) \times L^{p}(\Omega) \to L^{p}(\Omega) \times L^{p}(\Omega)$ for $p \geq 2$ implies
\[
\| (\text{curl} \, F, F) \|_{L^{p'} \times L^{p'}} \leq \sup_{\| (\tilde{E}, \tilde{E}) \|_{L^{p} \times L^{p}} \leq \| T_{I} \|_{p}} \left| \int_{\Omega} \{ \text{curl} \, E(x) \cdot \tilde{E}(x) + F(x) \cdot \tilde{E}(x) \} \, dx \right|
\]
Define $\tilde{E} := \frac{\tilde{E}}{\| T_{I} \|_{p}}$. Then we get,
\[
\| (\text{curl} \, F, F) \|_{L^{p'} \times L^{p'}} \leq \| T_{I} \|_{p} \sup_{\| (\tilde{E}, \tilde{E}) \|_{L^{p} \times L^{p}} \leq 1} \left| \int_{\Omega} \{ \text{curl} \, E(x) \cdot \tilde{E}(x) \cdot F(x) \cdot \tilde{E}(x) \} \, dx \right|
\]
Now, define $E := \frac{\tilde{E}}{\| (\tilde{E}, \tilde{E}) \|_{L^{p} \times L^{p}}}$. Therefore we obtain
\[
\| (\text{curl} \, F, F) \|_{L^{p'} \times L^{p'}} \leq \| T_{I} \|_{p} \sup_{\| (\tilde{E}, \tilde{E}) \|_{L^{p} \times L^{p}} \leq 1} \left| \int_{\Omega} \{ \text{curl} \, E(x) \cdot \tilde{E}(x) \cdot F(x) \cdot \tilde{E}(x) \} \, dx \right|
\]
Since $\| (\text{curl} \, E, E) \|_{L^{p} \times L^{p}} = \| E \|_{1,p}$, then taking infimum over $H_{0}^{1} \cdot \cdot \cdot (\text{curl}; \Omega)$ we obtain
\[
\inf_{\| F \|_{1,p} = 1} \sup_{\| E \|_{1,p} = 1} |B(E, F)| \geq \frac{1}{\| T_{I} \|_{p}}, \quad (4.13)
\]

\section{4.2 The perturbed problem}

\textbf{Lemma 4.4.} Let $\Omega$ be a bounded $C^{1}$ domain. Suppose that $A = A(x)$ is a Hermitian matrix, with measurable entries, and satisfies the uniformly ellipticity condition [4.5]. Assume that $q$ is some fixed number satisfying $2 \leq q < \infty$. Under the condition
\[
\inf_{\| F \|_{1,q} = 1} \sup_{\| E \|_{1,q} = 1} |B_{A}(E, F)| \geq \frac{1}{K} > 0, \quad (4.14)
\]
the Maxwell system of equations
\[
\text{curl} \, (A \cdot \text{curl} \, E) + E = \text{curl} \, f + g, \quad (4.15)
\]
is uniquely weakly solvable in $H_0^{1,q'}(\text{curl}; \Omega)$ for each $g \in L^{q'}(\Omega)$ and $f \in L^{q'}(\Omega)$ and the weak solution satisfies

$$\|E\|_{L^{q'}(\Omega)} + \|\text{curl} E\|_{L^{q'}(\Omega)} \leq K\{\|f\|_{L^{q'}(\Omega)} + \|g\|_{L^{q'}(\Omega)}\},$$

where $K$ is a positive constant depending on $p$.

**Proof.** Consider the system of equations

$$\text{curl}(A \cdot \text{curl} E) + E = \text{curl} f + g$$

where $g \in L^{q'}(\Omega)$ and $f \in L^{q'}(\Omega)$ for $q' \leq 2$.

Let $f_k$ and $g_k$, $k = 1, 2, \ldots$, be a sequence of vector fields in $L^2(\Omega)$ such that

$$\|f_k - f\|_{L^{q'}(\Omega)} \to 0 \quad \text{as} \quad k \to \infty,$$

$$\|g_k - g\|_{L^{q'}(\Omega)} \to 0 \quad \text{as} \quad k \to \infty.$$ 

Thus, from the $L^2$-theory of Maxwell equation, given $g_k \in L^2(\Omega)$ and $f_k \in L^2(\Omega)$, there exists unique $E_k \in H_0^1(\text{curl}; \Omega)$ such that

$$\int_\Omega A(x) \cdot \text{curl} E_k(x) \cdot \text{curl} F(x) \, dx + \int_\Omega E_k(x) \cdot F(x) \, dx = \int_\Omega f_k(x) \cdot \text{curl} F(x) \, dx + \int_\Omega g_k(x) \cdot F(x) \, dx$$

i.e.

$$\mathcal{B}_A(F, E_k) = \int_\Omega \text{curl} F(x) \cdot f_k(x) \, dx + \int_\Omega F(x) \cdot g_k(x) \, dx$$

(4.16)

holds for all $F \in H_0^1(\text{curl}; \Omega) = H_0^{1,2}(\text{curl}; \Omega)$. Since $H_0^{1,q}(\text{curl}; \Omega) \subset H_0^{1,2}(\text{curl}; \Omega) \subset H_0^{1,q'}(\text{curl}; \Omega)$ it follows from the assumption (4.14) and from (4.16) that

$$\|E_k\|_{L^{q'}(\Omega)} + \|\text{curl} E_k\|_{L^{q'}(\Omega)} \leq K\{\|f_k\|_{L^{q'}(\Omega)} + \|g_k\|_{L^{q'}(\Omega)}\}. \quad (4.17)$$

Since, $H_0^{1,q'}(\text{curl}; \Omega)$ is a reflexive space\footnote{One way to justify this property is as follows. We define the embedding map $i : H_0^{1,q'}(\text{curl}; \Omega) \to L^{q'}(\Omega) \times L^{q'}(\Omega)$ by $E \mapsto (E, \text{curl} E)$. Since $i$ is an isometric linear map and $H_0^{1,q'}(\text{curl}; \Omega)$ is complete then $i(H_0^{1,q'}(\text{curl}; \Omega))$ is a closed subspace of $L^{q'}(\Omega) \times L^{q'}(\Omega)$. As $L^{q'}(\Omega) \times L^{q'}(\Omega)$ is reflexive, see [10], Lemma 4.3 for instance, and since a closed subspace of a reflexive space is itself a reflexive, therefore $H_0^{1,q'}(\text{curl}; \Omega)$ is a reflexive space.} and $\{E_k\}$ is bounded in $H_0^{1,q'}(\text{curl}; \Omega)$, then $\{E_k\}$ has a weakly convergent subsequence in $H_0^{1,q'}(\text{curl}; \Omega)$, i.e, there exists $E \in H_0^{1,q'}(\text{curl}; \Omega)$ such that

$$E_{k_r} \rightharpoonup E \quad \text{in} \quad H_0^{1,q'}(\text{curl}; \Omega).$$

Therefore, we obtain

$$\|E\|_{1,q'} \leq \lim_{k_r \to \infty} \|E_{k_r}\|_{1,q'} \leq K \lim_{k_r \to \infty} \{\|f_{k_r}\|_{L^{q'}(\Omega)} + \|g_{k_r}\|_{L^{q'}(\Omega)}\} \leq K\{\|f\|_{L^{q'}(\Omega)} + \|g\|_{L^{q'}(\Omega)}\}. \quad (4.18)$$

Hence $E$ is in $H_0^{1,q'}(\text{curl}; \Omega)$, solves equation (4.15) and from (4.18), it satisfies the estimate

$$\|E\|_{L^{q'}(\Omega)} + \|\text{curl} E\|_{L^{q'}(\Omega)} \leq K\{\|f\|_{L^{q'}(\Omega)} + \|g\|_{L^{q'}(\Omega)}\}. \quad (4.19)$$

In addition, suppose that $E$ is a function in $H_0^{1,q'}(\text{curl}; \Omega)$ and solves equation (4.15) with $f = 0$ and $g = 0$. Then from (4.19) we see that $E = 0$. This shows that the solution is unique. \hfill $\square$
Now, we state the main result of this section.

**Theorem 4.5.** Let $\Omega$ be a bounded $C^1$ domain in $\mathbb{R}^3$. Consider the system of differential equations

$$\text{curl}(A \text{ curl } E) + E = \text{curl} f + g, \quad (4.20)$$

where $A = A(x)$ is a Hermitian matrix, with measurable entries, and satisfies the uniform ellipticity condition (4.4). Then for every $f \in L^p(\Omega)$ and $g \in L^p(\Omega)$, there exists $\delta > 0$ such that the problem (4.20) has a unique weak solution in $H^{1,p}_0(\Omega, \text{curl}; \Omega)$, where $p \in \left(\frac{2}{1+\delta}, 2\right]$. In addition, the solution satisfies the estimate

$$\|E\|_{L^p(\Omega)} + \|\text{curl } E\|_{L^p(\Omega)} \leq C\{\|f\|_{L^p(\Omega)} + \|g\|_{L^p(\Omega)}\}, \quad (4.21)$$

where $C$ is a constant depending only on $\Omega, \lambda$ and $p$.

**Proof.** Rewrite

$$\mathcal{B}_A(E, F) = \int_{\Omega} (A(x) \text{ curl } E(x) \cdot \text{ curl } F(x)) dx + \int_{\Omega} E(x) \cdot F(x) dx$$

$$= \int_{\Omega} \text{curl } E(x) \cdot \text{curl } F(x) dx + \int_{\Omega} E(x) \cdot F(x) dx + \int_{\Omega} (A - I)(x) \text{ curl } E(x) \cdot \text{curl } F(x) dx$$

$$= \mathcal{B}(E, F) + \tilde{\mathcal{B}}_A(E, F)$$

where, $\tilde{\mathcal{B}}_A(E, F) = \int_{\Omega} (A - I)(x) \text{ curl } E(x) \cdot \text{curl } F(x) dx$. Hence

$$\sup_{\|E\|_{1,p'}=1} |\mathcal{B}_A| \geq \sup_{\|E\|_{1,p}=1} |\mathcal{B}| - \sup_{\|E\|_{1,p}=1} |\tilde{\mathcal{B}}_A|, \quad (4.22)$$

where $2 \leq p' < \infty$, $F$ is in $H^{1,p}_0(\text{curl}; \Omega)$ and $E$ varies over $H^{1,p'}_0(\text{curl}; \Omega)$. Then from Lemma 4.3 applied for $p'$, we have

$$\sup_{\|E\|_{1,p'}=1} |\mathcal{B}| \geq \frac{1}{K_p'}\|F\|_{1,p}$$

Also, we have

$$\sup_{\|E\|_{1,p}=1} |\tilde{\mathcal{B}}_A| \leq (1 - \lambda)\|F\|_{1,p}$$

where the constant $K_p$ is defined as $K_p = \|T_I\|_p$ and the constant $\lambda$ is defined in (4.2). Therefore

$$\inf_{\|F\|_{1,p}=1} \sup_{\|E\|_{1,p}=1} |\mathcal{B}(E, F)| \geq \frac{1}{K_p'} - 1 + \lambda. \quad (4.23)$$

From the Riesz Convexity Theorem, $T_I$ is a bounded linear operator from $L^p(\Omega) \times L^p(\Omega) \to L^p(\Omega) \times L^p(\Omega)$ for every $p$ in the range $1 \leq p < \infty$ and $\log \|T_I\|_p$ is a convex function of $\frac{1}{p}$, see [2]. In particular, the function $p \mapsto \|T_I\|_p$ is continuous for $p \in [1, \infty)$. Now, define $F : [1, \infty) \to \mathbb{R}$ by $F(p) := \frac{1}{K_p'} - 1 + \lambda$. As $F(2) = \lambda > 0$ and $F(p)$ is continuous, then there exists $\delta > 0$ such that $F(p) > 0$ for all $p \in (2 - \delta, 2 + \delta)$. Thus, in the interval $2 \leq p' < 2 + \delta$ we have

$$\inf_{\|F\|_{1,p}=1} \sup_{\|E\|_{1,p}=1} |\mathcal{B}_A(E, F)| \geq \frac{1}{K_p'} > 0 \quad (4.24)$$

where $\tilde{K}_p' = \frac{K_p'}{1 - K_p'(1 - \lambda)}$. The rest is a consequence of Lemma 4.4 (taking $q' = p$). \qed

**Remark 4.6.** To deal with the case $p > 2$, we need the corresponding result to Lemma 4.3 for $q < 2$. So far, the technique in [10] does not go for the Maxwell system as naturally as for the case $q > 2$ described in the proof of Lemma 4.4. For $p > 2$, the approach by Gröger, see [3], might be the correct one. The details will be given in a forthcoming work.
5 Appendix

Here, we recall some important properties from [1] concerning the vector layer potentials and some Sobolev spaces useful for the study of the problems related to the Maxwell system.

The Surface Divergence

Let $\Omega \subset \mathbb{R}^3$ be a bounded Lipschitz domain and $A \in L^p_{\tan}(\partial \Omega)$, we define $\text{Div} \ A$ as a linear functional

$$\langle \text{Div} \ A, f \rangle := -\int_{\partial \Omega} A(x) \cdot \nabla_{\tan} f(x) \, ds(x) \quad (5.1)$$

where $f$ is any Lipschitz continuous function on $\partial \Omega$ and the space $L^p_{\tan}(\partial \Omega)$ is defined as

$$L^p_{\tan}(\partial \Omega) := \{ A : \partial \Omega \to \mathbb{C}^3; A \in L^p(\partial \Omega), (\nu, A) = 0 \text{ a.e. on } \partial \Omega \},$$

where $1 < p < \infty$ and the usual tangential gradient $\nabla_{\tan} := -\nu \times (\nu \times \nabla)$.

In the following theorem we gather some of the key properties which are useful in our analysis in the previous sections.

**Theorem 5.1.** Let $D$ be a bounded Lipschitz domain and $\Omega$ be a bounded $C^1$ domain in $\mathbb{R}^3$ and let $p$ be real number such that $1 < p < \infty$. Then we have the following properties:

**Property 1.** The operator $S_k$ is a compact operator on $L^p(\partial D)$. Also, the operator $S_k$ maps $W^{-\frac{1}{2},p}(\partial D)$ boundedly into $W^{1,p}(D)$ (and also into $W^{1,p}(\Omega \setminus \overline{D})$ if $\overline{D} \subset \Omega$). In particular, $\nu \cdot \nabla S_k = -\frac{1}{2}I + K_k \ast$ on $W^{-\frac{1}{2},p}(\partial D)$.

**Property 2.** Let $u \in L^p(D)$ such that $\text{curl} \, u \in L^p(D)$. If $\nu \wedge u \in L^p(\partial D)$, then in fact $\nu \wedge u \in L^p_{\tan}(\partial D)$ and $\text{Div}(\nu \wedge u) = -\nu \cdot \text{curl} \, u$. In particular, $\text{Div}(\nu \wedge u) \in W^{-\frac{1}{2},p}(\partial D)$.

**Property 3.** For $k \in \mathbb{C}$, and $A \in L^p_{\tan}(\partial D)$, we have $\text{div} \, S_k A = S_k(\text{Div} \, A)$ in $\mathbb{R}^3 \setminus \partial D$.

**Property 4.** If the vector field $u \in L^p(D)$ is such that $\text{curl} \, u \in L^p(D)$, then $\nu \wedge u \in W^{-\frac{1}{2},p}(\partial D)$ and there exists a positive constant $C$ depending only on the Lipschitz character of $\partial D$ so that

$$\|\nu \wedge u\|_{W^{-\frac{1}{2},p}(\partial D)} \leq C(\|u\|_{L^p(D)} + \|\text{curl} \, u\|_{L^p(D)}).$$

Also, if $u \in L^p(D)$ is such that $\text{div} \, u \in L^p(D)$, then $\nu \cdot u \in W^{-\frac{1}{2},p}(\partial D)$ and

$$\|\nu \cdot u\|_{W^{-\frac{1}{2},p}(\partial D)} \leq C(\|u\|_{L^p(D)} + \|\text{div} \, u\|_{L^p(D)}).$$

for some positive $C$ depending only on the Lipschitz character of $\partial D$.

**Property 5.** Consider a vector field $u \in L^p(D)$ such that $\text{div} \, u \in L^p(D)$ and $\text{curl} \, u \in L^p(D)$. If $\nu \wedge u \in L^p(\partial D)$, then also $\nu \cdot u \in L^p(\partial D)$, for $p \in (1, \infty)$. If in addition $1 < p \leq 2$, then $u \in B^p_{\frac{1}{2}}(D)$ and we have the estimate

$$\|u\|_{B^p_{\frac{1}{2}}(D)} \leq C(\|u\|_{L^p(D)} + \|\text{curl} \, u\|_{L^p(D)} + \|\nabla \cdot u\|_{L^p(D)} + \|\nu \wedge u\|_{L^p(\partial D)})$$

where the Sobolev-Besov space $B^p_{\alpha,q}(D) := [L^p(D), W^{1,p}(D)]_{\alpha,q}$ is obtained by real interpolation for $1 < p, q < \infty$ and $0 < \alpha < 1$.

**Property 6.** Assume that $k \in \mathbb{C} \setminus \{0\}$ with $\text{Im} \, k \geq 0$ is not a Maxwell eigenvalue for $\Omega$. Then for given $K \in L^p(\Omega)$ and $J \in L^p(\Omega)$, the following problem

$$\begin{align*}
\text{curl} \, E - ikH &= K \quad \text{in} \ \Omega, \\
\text{curl} \, H + ikE &= J \quad \text{in} \ \Omega, \\
\nu \wedge E &= 0 \quad \text{on} \ \partial \Omega,
\end{align*}$$

(5.2)
has a unique solution and there exists \( C = C(p, k, \Omega) > 0 \) such that
\[
\|E\|_{L^p(\Omega)} + \|H\|_{L^p(\Omega)} \leq C \{ \|K\|_{L^p(\Omega)} + \|J\|_{L^p(\Omega)} \}
\]
for \( 1 < p < \infty \).

The properties \( \mathbb{I} \) (except the boundedness of \( S_k \) from \( W^{-1/p,p}(\partial D) \) into \( W^{1-p}((\partial \Omega) \cup \partial D) \)), \( \mathbb{E} \), \( \mathbb{F} \) and \( \mathbb{G} \) are proved as Lemma 3.1, Lemma 4.1, Lemma 4.2, Lemma 2.3, Corollary 10.3 and Theorem 11.6 in [11] respectively. For the sake of completeness, we show the boundedness of \( S_k : W^{-1/p,p}(\partial D) \to W^{1-p}(\Omega \setminus D) \), for \( 1 < p < \infty \).

Indeed, recall that
\[
S_k f(x) = \int_{\partial D} \Phi_k(x, y) f(y) ds(y), \quad x \in \mathbb{R}^3 \setminus \partial D.
\]
As the trace map \( \gamma : W^{1,p}(\Omega \setminus D) \to W^{1-1/p,p}(\partial \Omega \cup \partial D) \) is bounded and has a bounded right inverse then
\[
\|S_k f\|_{W^{1-1/p,p}(\partial D)} \leq C[\|S_k f\|_{W^{1-1/p,p}(\partial D)} + \|S_k f\|_{W^{1/p,p}(\partial \Omega)}]. \tag{5.3}
\]
Note that, \( S_k : W^{-1/p,p}(\partial D) \to W^{1/p}(D) \) is bounded, see Property \( \mathbb{I} \) of Theorem 5.1 or \( \mathbb{I} \), Lemma 3.1, and also the trace map \( \gamma : W^{1,p}(D) \to W^{1-1/p,p}(\partial D) \) is bounded. Therefore
\[
\|S_k f\|_{W^{1-1/p,p}(\partial \Omega)} \leq C\|S_k f\|_{W^{1,p}(D)} \leq C\|f\|_{W^{-1/p,p}(\partial \partial \Omega)} \tag{5.4}
\]
On the other hand
\[
\|S_k f\|_{W^{1-1/p,p}(\partial \Omega)}^p = \int_{\partial \Omega} |S_k f(x)|^p ds(x) + \int_{\partial \Omega} \int_{\partial \Omega} \frac{|S_k f(x) - S_k f(y)|^p}{|x - y|^{2+p(1-1/p)}} ds(x) ds(y)
\]
\[
= I + II.
\]
Since, \( c_1 < |x - y| < c_2 \) for \( x \in \partial \Omega \) and \( y \in \partial D \), therefore
\[
|I| \leq \int_{\partial \Omega} \left( \int_{\partial D} \frac{1}{|x - y|} |f(y)| ds(y) \right)^p ds(x) \leq \frac{1}{c_1} \int_{\partial \Omega} \left( \int_{\partial D} |f(y)| ds(y) \right)^p ds(x)
\]
\[
\leq C\|f\|_{W^{-1/p,p}(\partial \partial \Omega)}^p.
\]
Using the Taylor expansion of \( e^{ikt}, t \in \mathbb{R} \), we can show that for \( x, y, \in \partial \Omega \) and \( z \in \partial D \) where \( D \subset \Omega \), we have
\[
\left| \frac{e^{ik|x-z|}}{|x-z|} - \frac{e^{ik|y-z|}}{|y-z|} \right| \leq C|x - y|. \tag{5.5}
\]
Note that
\[
|S_k f(x) - S_k f(y)| = |\int_{\partial D} [\Phi_k(x, z) - \Phi_k(y, z)] f(z) ds(z) |
\]
\[
= |\int_{\partial D} \left[ \frac{1}{4\pi} \left( \frac{e^{ik|x-z|}}{|x-z|} - \frac{e^{ik|y-z|}}{|y-z|} \right) \right] f(z) ds(z) |
\]
(\text{using } 5.5)
\[
\leq C|x - y| \int_{\partial D} |f(z)| ds(z)
\]
\[
\leq C|x - y|\|f\|_{W^{-1/p,p}(\partial \partial \Omega)}.
\]
Therefore
\[
|II| \leq C\|f\|_{W^{-1/p,p}(\partial \partial \Omega)}^p \int_{\partial \Omega} \int_{\partial \Omega} \frac{|x - y|^p}{|x - y|^{2+p(1-1/p)}} ds(x) ds(y)
\]
25
\[
\int_{\partial\Omega} \int_{\partial\Omega} \frac{1}{|x-y|} ds(x) ds(y) \leq C \|f\|_{W^{-1/p, p}(\partial D)}^p.
\]

Hence
\[
\|S_k f\|_{W^{1-1/p, p}(\partial\Omega)} \leq C \|f\|_{W^{-1/p, p}(\partial D)}.
\]

Combining (5.3), (5.4) and (5.6), we obtain
\[
\|S_k f\|_{W^{1-p, p}(\Omega \setminus \overline{D})} \leq C \|f\|_{W^{-1/p, p}(\partial D)}.
\]
